Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	Coldfire V2
Core Size	32-Bit Single-Core
Speed	80MHz
Connectivity	CANbus, Ethernet, I²C, QSPI, UART/USART, USB OTG
Peripherals	DMA, LVD, POR, PWM, WDT
Number of I/O	56
Program Memory Size	512KB (512K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	64K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 8x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	100-LQFP
Supplier Device Package	100-LQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/pcf52255caf80

1 Family Configurations

Table 1. MCF52259 Family Configurations

Module	52252	52254	52255	52256	52258	52259
Version 2 ColdFire Core with eMAC (Enhanced multiply-accumulate unit) and CAU (Cryptographic acceleration unit)	•	•	•	•	•	•
System Clock	up to 66 or 80 MHz[1]		up to 80 MHz[1]	up to 66 or 80 MHz[1]		up to 80 MHz[1]
Performance (Dhrystone 2.1 MIPS)	up to 63 or 76

JTAG - IEEE 1149.1 Test Access Port	•	•	•	•	•	•
Package	100 LQFP			144 LQFP or 144 MAPBGA		

[1] 66 MHz = 63 MIPS; 80 MHz = 76 MIPS

  - DMA or FIFO data stream interfaces
  - Low power consumption
  - OTG protocol logic
- Fast Ethernet controller (FEC)
  - 10/100 BaseT/TX capability, half duplex or full duplex
  - On-chip transmit and receive FIFOs
  - Built-in dedicated DMA controller
  - Memory-based flexible descriptor rings
- Mini-FlexBus
  - External bus interface available on 144 pin packages
  - Supports glueless interface with 8-bit ROM/flash/SRAM/simple slave peripherals. Can address up to 2 MB of addresses
  - 2 chip selects ($\overline{\text{FB\_CS}}$[1:0])
  - Non-multiplexed mode: 8-bit dedicated data bus, 20-bit address bus
  - Multiplexed mode: 16-bit data and 20-bit address bus
  - FB_CLK output to support synchronous memories
  - Programmable base address, size, and wait states to support slow peripherals
  - Operates at up to 40 MHz (bus clock) in 1:2 mode or up to 80 MHz (core clock) in 1:1 mode
- Three universal asynchronous/synchronous receiver transmitters (UARTs)
  - 16-bit divider for clock generation
  - Interrupt control logic with maskable interrupts
  - DMA support
  - Data formats can be 5, 6, 7, or 8 bits with even, odd, or no parity
  - Up to two stop bits in 1/16 increments
  - Error-detection capabilities
  - Modem support includes request-to-send (RTS) and clear-to-send (CTS) lines for two UARTs
  - Transmit and receive FIFO buffers
- Two I2C modules
  - Interchip bus interface for EEPROMs, LCD controllers, A/D converters, and keypads
  - Fully compatible with industry-standard I2C bus
  - Master and slave modes support multiple masters
  - Automatic interrupt generation with programmable level
- Queued serial peripheral interface (QSPI)
  - Full-duplex, three-wire synchronous transfers
  - Up to three chip selects available
  - Master mode operation only
  - Programmable bit rates up to half the CPU clock frequency
  - Up to 16 pre-programmed transfers
- Fast analog-to-digital converter (ADC)
  - Eight analog input channels
  - 12-bit resolution
  - Minimum 1.125 μs conversion time
  - Simultaneous sampling of two channels for motor control applications
  - Single-scan or continuous operation
  - Optional interrupts on conversion complete, zero crossing (sign change), or under/over low/high limit

  - Unused analog channels can be used as digital I/O
- Four 32-bit timers with DMA support
  - 12.5 ns resolution at 80 MHz
  - Programmable sources for clock input, including an external clock option
  - Programmable prescaler
  - Input capture capability with programmable trigger edge on input pin
  - Output compare with programmable mode for the output pin
  - Free run and restart modes
  - Maskable interrupts on input capture or output compare
  - DMA trigger capability on input capture or output compare
- Four-channel general purpose timer
  - 16-bit architecture
  - Programmable prescaler
  - Output pulse-widths variable from microseconds to seconds
  - Single 16-bit input pulse accumulator
  - Toggle-on-overflow feature for pulse-width modulator (PWM) generation
  - One dual-mode pulse accumulation channel
- Pulse-width modulation timer
  - Support for PCM mode (resulting in superior signal quality compared to conventional PWM)
  - Operates as eight channels with 8-bit resolution or four channels with 16-bit resolution
  - Programmable period and duty cycle
  - Programmable enable/disable for each channel
  - Software selectable polarity for each channel
  - Period and duty cycle are double buffered. Change takes effect when the end of the current period is reached (PWM counter reaches zero) or when the channel is disabled.
  - Programmable center or left aligned outputs on individual channels
  - Four clock sources (A, B, SA, and SB) provide for a wide range of frequencies
  - Emergency shutdown
- Two periodic interrupt timers (PITs)
  - 16-bit counter
  - Selectable as free running or count down
- Real-Time Clock (RTC)
  - Maintains system time-of-day clock
  - Provides stopwatch and alarm interrupt functions
  - Standby power supply (Vstby) keeps the RTC running when the system is shut down
- Software watchdog timer
  - 32-bit counter
  - Low-power mode support
- Backup watchdog timer (BWT)
  - Independent timer that can be used to help software recover from runaway code
  - 16-bit counter
  - Low-power mode support
- Clock generation features
  - Crystal, on-chip trimmed relaxation oscillator, or external oscillator reference options
  - Trimmed relaxation oscillator

  - Pre-divider capable of dividing the clock source frequency into the PLL reference frequency range
  - System can be clocked from PLL or directly from crystal oscillator or relaxation oscillator
  - Low power modes supported
  - 2^n ($0 \le n \le 15$) low-power divider for extremely low frequency operation
- Interrupt controller
  - Uniquely programmable vectors for all interrupt sources
  - Fully programmable level and priority for all peripheral interrupt sources
  - Seven external interrupt signals with fixed level and priority
  - Unique vector number for each interrupt source
  - Ability to mask any individual interrupt source or all interrupt sources (global mask-all)
  - Support for hardware and software interrupt acknowledge (IACK) cycles
  - Combinatorial path to provide wake-up from low-power modes
- DMA controller
  - Four fully programmable channels
  - Dual-address transfer support with 8-, 16-, and 32-bit data capability, along with support for 16-byte (4×32-bit) burst transfers
  - Source/destination address pointers that can increment or remain constant
  - 24-bit byte transfer counter per channel
  - Auto-alignment transfers supported for efficient block movement
  - Bursting and cycle-steal support
  - Software-programmable DMA requests for the UARTs (3) and 32-bit timers (4)
  - Channel linking support
- Reset
  - Separate reset in and reset out signals
  - Seven sources of reset:
    - Power-on reset (POR)
    - External
    - Software
    - Watchdog
    - Loss of clock / loss of lock
    - Low-voltage detection (LVD)
    - JTAG
  - Status flag indication of source of last reset
- Chip configuration module (CCM)
  - System configuration during reset
  - Selects one of six clock modes
  - Configures output pad drive strength
  - Unique part identification number and part revision number
- General purpose I/O interface
  - Up to 56 bits of general purpose I/O on 100-pin package
  - Up to 96 bits of general purpose I/O on 144-pin package
  - Bit manipulation supported via set/clear functions
  - Programmable drive strengths
  - Unused peripheral pins may be used as extra GPIO
- JTAG support for system level board testing

1.2.5 On-Chip Memories

1.2.5.1 SRAM

The dual-ported SRAM module provides a general-purpose 64 KB memory block that the ColdFire core can access in a single cycle. The location of the memory block can be set to any 64 KB boundary within the 4 GB address space. This memory is ideal for storing critical code or data structures and for use as the system stack. Because the SRAM module is physically connected to the processor's high-speed local bus, it can quickly service core-initiated accesses or memory-referencing commands from the debug module.

The SRAM module is also accessible by the DMA, FEC, and USB. The dual-ported nature of the SRAM makes it ideal for implementing applications with double-buffer schemes, where the processor and a DMA device operate in alternate regions of the SRAM to maximize system performance.

1.2.5.2 Flash Memory

The ColdFire flash module (CFM) is a non-volatile memory (NVM) module that connects to the processor’s high-speed local bus. The CFM is constructed with four banks of 64 KB×16-bit flash memory arrays to generate 512 KB of 32-bit flash memory. These electrically erasable and programmable arrays serve as non-volatile program and data memory. The flash memory is ideal for program and data storage for single-chip applications, allowing for field reprogramming without requiring an external high voltage source. The CFM interfaces to the ColdFire core through an optimized read-only memory controller that supports interleaved accesses from the 2-cycle flash memory arrays. A backdoor mapping of the flash memory is used for all program, erase, and verify operations, as well as providing a read datapath for the DMA. Flash memory may also be programmed via the EzPort, which is a serial flash memory programming interface that allows the flash memory to be read, erased and programmed by an external controller in a format compatible with most SPI bus flash memory chips.

1.2.6 Cryptographic Acceleration Unit

The MCF52235 device incorporates two hardware accelerators for cryptographic functions. First, the CAU is a coprocessor tightly-coupled to the V2 ColdFire core that implements a set of specialized operations to increase the throughput of software-based encryption and message digest functions, specifically the DES, 3DES, AES, MD5 and SHA-1 algorithms. Second, a random number generator provides FIPS-140 compliant 32-bit values to security processing routines. Both modules supply critical acceleration to software-based cryptographic algorithms at a minimal hardware cost.

1.2.7 Power Management

The device incorporates several low-power modes of operation entered under program control and exited by several external trigger events. An integrated power-on reset (POR) circuit monitors the input supply and forces an MCU reset as the supply voltage rises. The low voltage detector (LVD) monitors the supply voltage and is configurable to force a reset or interrupt condition if it falls below the LVD trip point. The RAM standby switch provides power to RAM when the supply voltage to the chip falls below the standby battery voltage.

1.2.8 FlexCAN

The FlexCAN module is a communication controller implementing version 2.0 of the CAN protocol parts A and B. The CAN protocol can be used as an industrial control serial data bus, meeting the specific requirements of reliable operation in a harsh EMI environment with high bandwidth. This instantiation of FlexCAN has 16 message buffers.

Figure 2 shows the pinout configuration for the 144 LQFP.

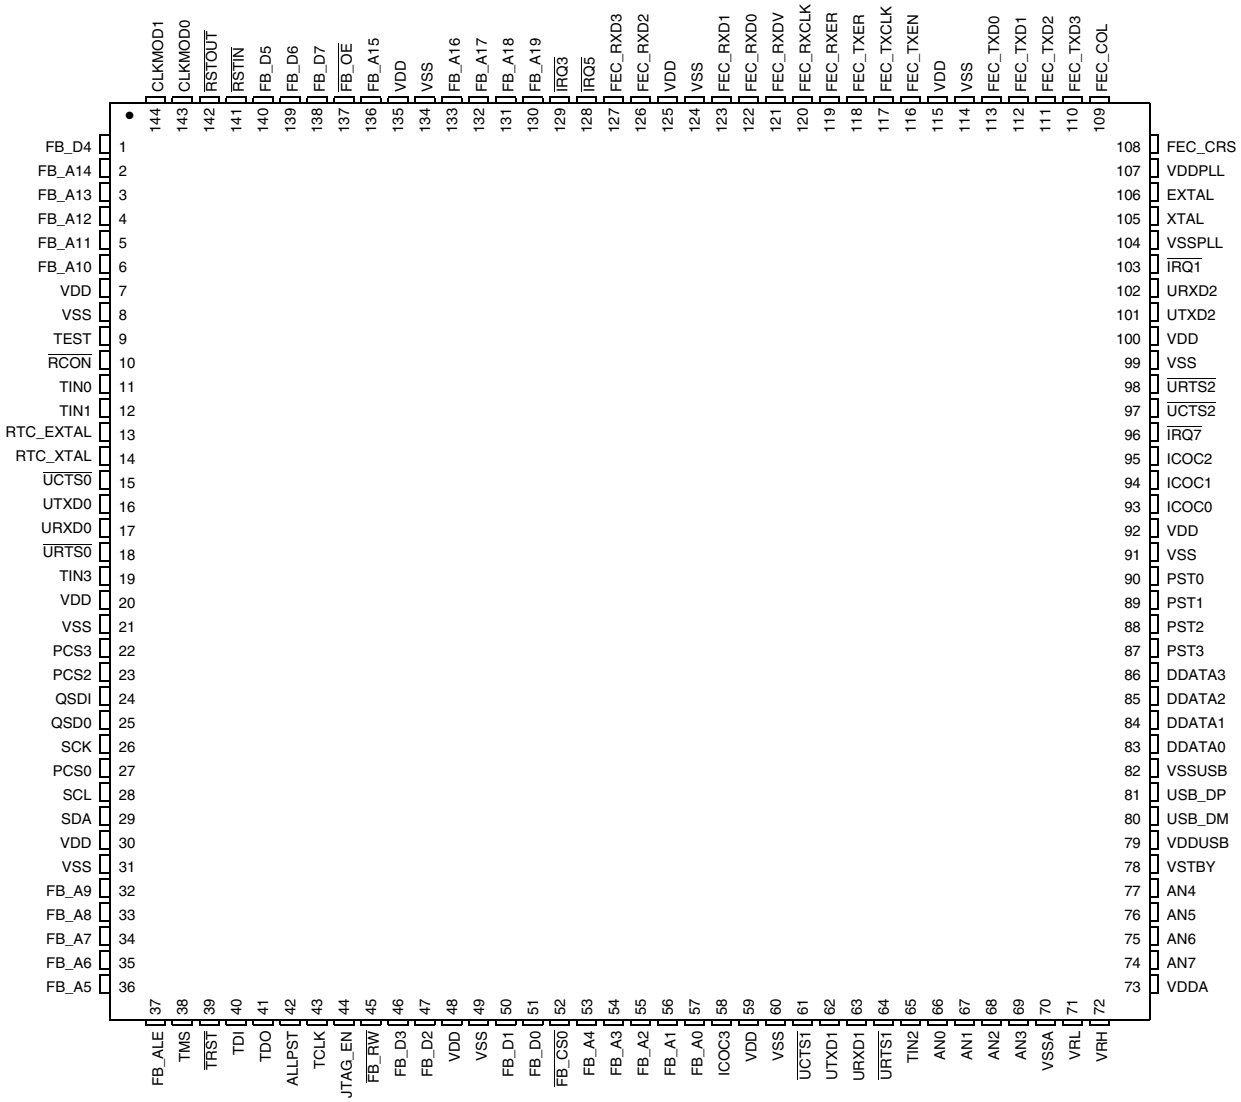

Figure 2. 144 LQFP Pin Assignment

Table 3 shows the pin functions by primary and alternate purpose, and illustrates which packages contain each pin.

Table 3. Pin Functions by Primary and Alternate Purpose

Pin Group	Primary Function	Secondary Function (Alt 1)	Tertiary Function (Alt 2)	Quaternary Function (GPIO)	Slew Rate	Drive Strength/Control[1]	Pull-up/ Pull-down[2]	Pin on 144 MAPBGA	Pin on 144 LQFP	Pin on 100 LQFP
ADC	AN[7:0]	—	—	PAN[7:0]	Low	Low	—	L12, K10, K12, K11, K9, L9, M10, M9	74–77; 69, 68, 67 ,66	51–54, 46, 45, 44, 43

2 Electrical Characteristics

This section contains electrical specification tables and reference timing diagrams for the microcontroller unit, including detailed information on power considerations, DC/AC electrical characteristics, and AC timing specifications.

NOTE

The parameters specified in this data sheet supersede any values found in the module specifications.

2.1 Maximum Ratings

Table 4. Absolute Maximum Ratings[1, 2]

Rating	Symbol	Value	Unit
Supply voltage	V_{DD}	–0.3 to +4.0	V
Clock synthesizer supply voltage	V_{DDPLL}	–0.3 to +4.0	V
RAM standby supply voltage	V_{STBY}	+1.8 to 3.5	V
USB standby supply voltage	V_{DDUSB}	–0.3 to +4.0	V
Digital input voltage [3]	V_{IN}	–0.3 to +4.0	V
EXTAL pin voltage	V_{EXTAL}	0 to 3.3	V
XTAL pin voltage	V_{XTAL}	0 to 3.3	V
Instantaneous maximum current Single pin limit (applies to all pins)[4, 5]	I_{DD}	25	mA
Operating temperature range (packaged)	T_A (T_L - T_H)	–40 to 85 or 0 to 70[6]	°C
Storage temperature range	T_{stg}	–65 to 150	°C

1 Functional operating conditions are given in DC Electrical Specifications. Absolute Maximum Ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond those listed may affect device reliability or cause permanent damage to the device.

2 This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (V_{SS} or V_{DD}).

3 Input must be current limited to the I_{DD} value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger of the two values.

4 All functional non-supply pins are internally clamped to V_{SS} and V_{DD}.

5 The power supply must maintain regulation within operating V_{DD} range during instantaneous and operating maximum current conditions. If positive injection current ($V_{in} > V_{DD}$) is greater than I_{DD}, the injection current may flow out of V_{DD} and could result in the external power supply going out of regulation. Ensure that the external V_{DD} load shunts current greater than maximum injection current. This is the greatest risk when the MCU is not consuming power (e.g., no clock).

6 Depending on the packaging; see orderable part number summary (Table 2)

Table 7. Current Consumption in Low-Power Mode, Code From SRAM[1,2,3]

Mode	8 MHz (Typ)	16 MHz (Typ)	64 MHz (Typ)	80 MHz (Typ)	Unit	Symbol
Stop mode 3 (Stop 11)[4]	0.090				mA	I_{DD}
Stop mode 2 (Stop 10)[4]	7					
Stop mode 1 (Stop 01)[4,5]	9	10	15	17		
Stop mode 0 (Stop 00)[5]	9	10	15	17		
Wait / Doze	13	18	42	50		
Run	16	21	55	65		

1 All values are measured with a 3.3 V power supply. Tests performed at room temperature.
2 Refer to the Power Management chapter in the *MCF52259 Reference Manual* for more information on low-power modes.
3 CLKOUT, PST/DDATA signals, and all peripheral clocks except UART0 off before entering low-power mode. CLKOUT is disabled. Code executed from SRAM with flash memory shut off by writing 0x0 to the FLASHBAR register.
4 See the description of the Low-Power Control Register (LPCR) in the *MCF52259 Reference Manual* for more information on stop modes 0–3.
5 Results are identical to STOP 00 for typical values because they only differ by CLKOUT power consumption. CLKOUT is already disabled in this instance prior to entering low-power mode.

2.3 Thermal Characteristics

Table 8 lists thermal resistance values.

Table 8. Thermal Characteristics

	Characteristic		Symbol	Value	Unit
144 MAPBGA	Junction to ambient, natural convection	Single layer board (1s)	θ_{JA}	53[1,2]	°C/W
	Junction to ambient, natural convection	Four layer board (2s2p)	θ_{JA}	30[1,3]	°C/W
	Junction to ambient, (@200 ft/min)	Single layer board (1s)	θ_{JMA}	43[1,3]	°C/W
	Junction to ambient, (@200 ft/min)	Four layer board (2s2p)	θ_{JMA}	26[1,3]	°C/W
	Junction to board	—	θ_{JB}	16[4]	°C/W
	Junction to case	—	θ_{JC}	9[5]	°C/W
	Junction to top of package	Natural convection	Ψ_{jt}	2[6]	°C/W
	Maximum operating junction temperature	—	T_j	105	°C
144 LQFP	Junction to ambient, natural convection	Single layer board (1s)	θ_{JA}	44[7,8]	°C/W
	Junction to ambient, natural convection	Four layer board (2s2p)	θ_{JA}	35[1,9]	°C/W
	Junction to ambient, (@200 ft/min)	Single layer board (1s)	θ_{JMA}	35[1,3]	°C/W
	Junction to ambient, (@200 ft/min)	Four layer board (2s2p)	θ_{JMA}	29[1,3]	°C/W
	Junction to board	—	θ_{JB}	23[10]	°C/W
	Junction to case	—	θ_{JC}	7[11]	°C/W
	Junction to top of package	Natural convection	Ψ_{jt}	2[12]	°C/W
	Maximum operating junction temperature	—	T_j	105	°C

Table 8. Thermal Characteristics (continued)

	Characteristic		Symbol	Value	Unit
100 LQFP	Junction to ambient, natural convection	Single layer board (1s)	θ_{JA}	53[13,14]	°C/W
	Junction to ambient, natural convection	Four layer board (2s2p)	θ_{JA}	39[1,15]	°C/W
	Junction to ambient, (@200 ft/min)	Single layer board (1s)	θ_{JMA}	42[1,3]	°C/W
	Junction to ambient, (@200 ft/min)	Four layer board (2s2p)	θ_{JMA}	33[1,3]	°C/W
	Junction to board	—	θ_{JB}	25[16]	°C/W
	Junction to case	—	θ_{JC}	9[17]	°C/W
	Junction to top of package	Natural convection	Ψ_{jt}	2[18]	°C/W
	Maximum operating junction temperature	—	T_j	105	°C

1 θ_{JA} and Ψ_{jt} parameters are simulated in conformance with EIA/JESD Standard 51-2 for natural convection. Freescale recommends the use of θ_{JA} and power dissipation specifications in the system design to prevent device junction temperatures from exceeding the rated specification. System designers should be aware that device junction temperatures can be significantly influenced by board layout and surrounding devices. Conformance to the device junction temperature specification can be verified by physical measurement in the customer's system using the Ψ_{jt} parameter, the device power dissipation, and the method described in EIA/JESD Standard 51-2.

2 Per JEDEC JESD51-2 with the single-layer board (JESD51-3) horizontal.

3 Per JEDEC JESD51-6 with the board JESD51-7) horizontal.

4 Thermal resistance between the die and the printed circuit board in conformance with JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.

5 Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).

6 Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written in conformance with Psi-JT.

7 θ_{JA} and Ψ_{jt} parameters are simulated in conformance with EIA/JESD Standard 51-2 for natural convection. Freescale recommends the use of θ_{JA} and power dissipation specifications in the system design to prevent device junction temperatures from exceeding the rated specification. System designers should be aware that device junction temperatures can be significantly influenced by board layout and surrounding devices. Conformance to the device junction temperature specification can be verified by physical measurement in the customer's system using the Ψ_{jt} parameter, the device power dissipation, and the method described in EIA/JESD Standard 51-2.

8 Per JEDEC JESD51-2 with the single-layer board (JESD51-3) horizontal.

9 Per JEDEC JESD51-6 with the board JESD51-7) horizontal.

10 Thermal resistance between the die and the printed circuit board in conformance with JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.

11 Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).

12 Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written in conformance with Psi-JT.

13 θ_{JA} and Ψ_{jt} parameters are simulated in conformance with EIA/JESD Standard 51-2 for natural convection. Freescale recommends the use of θ_{JA} and power dissipation specifications in the system design to prevent device junction temperatures from exceeding the rated specification. System designers should be aware that device junction temperatures can be significantly influenced by board layout and surrounding devices. Conformance to the device junction temperature specification can be verified by physical measurement in the customer's system using the Ψ_{jt} parameter, the device power dissipation, and the method described in EIA/JESD Standard 51-2.

14 Per JEDEC JESD51-2 with the single-layer board (JESD51-3) horizontal.

15 Per JEDEC JESD51-6 with the board JESD51-7) horizontal.

[2] Reprogramming of a flash memory array block prior to erase is not required.

2.5 EzPort Electrical Specifications

Table 11. EzPort Electrical Specifications

Name	Characteristic	Min	Max	Unit
EP1	EPCK frequency of operation (all commands except READ)	—	f_{sys} / 2	MHz
EP1a	EPCK frequency of operation (READ command)	—	f_{sys} / 8	MHz
EP2	EPCS_b negation to next EPCS_b assertion	2 × T_{cyc}	—	ns
EP3	EPCS_B input valid to EPCK high (setup)	5	—	ns
EP4	EPCK high to EPCS_B input invalid (hold)	5	—	ns
EP5	EPD input valid to EPCK high (setup)	2	—	ns
EP6	EPCK high to EPD input invalid (hold)	5	—	ns
EP7	EPCK low to EPQ output valid (out setup)	—	12	ns
EP8	EPCK low to EPQ output invalid (out hold)	0	—	ns
EP9	EPCS_B negation to EPQ tri-state	—	12	ns

2.6 ESD Protection

Table 12. ESD Protection Characteristics[1, 2]

Characteristics	Symbol	Value	Units
ESD target for Human Body Model	HBM	2000	V
ESD target for Machine Model	MM	200	V
HBM circuit description	R_{series}	1500	Ω
	C	100	pF
MM circuit description	R_{series}	0	Ω
	C	200	pF
Number of pulses per pin (HBM) • Positive pulses • Negative pulses	 — —	 1 1	—
Number of pulses per pin (MM) • Positive pulses • Negative pulses	 — —	 3 3	—
Interval of pulses	—	1	sec

[1] All ESD testing is in conformity with CDF-AEC-Q100 Stress Test Qualification for Automotive Grade Integrated Circuits.

[2] A device is defined as a failure if after exposure to ESD pulses the device no longer meets the device specification requirements. Complete DC parametric and functional testing is performed per applicable device specification at room temperature followed by hot temperature, unless specified otherwise in the device specification.

2.9 USB Operation

Table 15. USB Operation Specifications

Characteristic	Symbol	Value	Unit
Minimum core speed for USB operation	$f_{sys\_USB\_min}$	16	MHz

2.10 Mini-FlexBus External Interface Specifications

A multi-function external bus interface called Mini-FlexBus is provided with basic functionality to interface to slave-only devices up to a maximum bus frequency of 80 MHz. It can be directly connected to asynchronous or synchronous devices such as external boot ROMs, flash memories, gate-array logic, or other simple target (slave) devices with little or no additional circuitry. For asynchronous devices a simple chip-select based interface can be used.

All processor bus timings are synchronous; that is, input setup/hold and output delay are given in respect to the rising edge of a reference clock, MB_CLK. The MB_CLK frequency is half the internal system bus frequency.

The following timing numbers indicate when data is latched or driven onto the external bus, relative to the Mini-FlexBus output clock (MB_CLK). All other timing relationships can be derived from these values.

Table 16. Mini-FlexBus AC Timing Specifications

Num	Characteristic	Min	Max	Unit	Notes
	Frequency of Operation	—	80	MHz	
MB1	Clock Period	12.5	—	ns	
MB2	Output Valid	—	8	ns	[1]
MB3	Output Hold	2	—	ns	[1]
MB4	Input Setup	6	—	ns	[2]
MB5	Input Hold	0	—	ns	[2]

[1] Specification is valid for all MB_A[19:0], MB_D[7:0], $\overline{\text{MB\_CS}}$[1:0], $\overline{\text{MB\_OE}}$, MB_R/$\overline{\text{W}}$, and MB_ALE.

[2] Specification is valid for all MB_D[7:0].

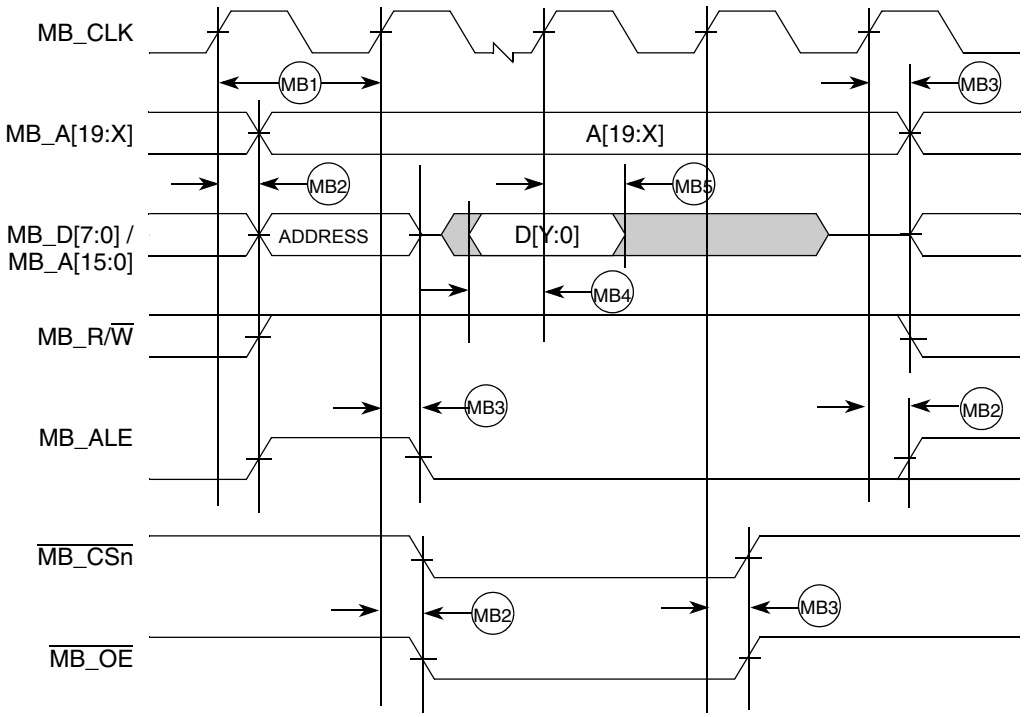

Figure 5. Mini-FlexBus Read Timing

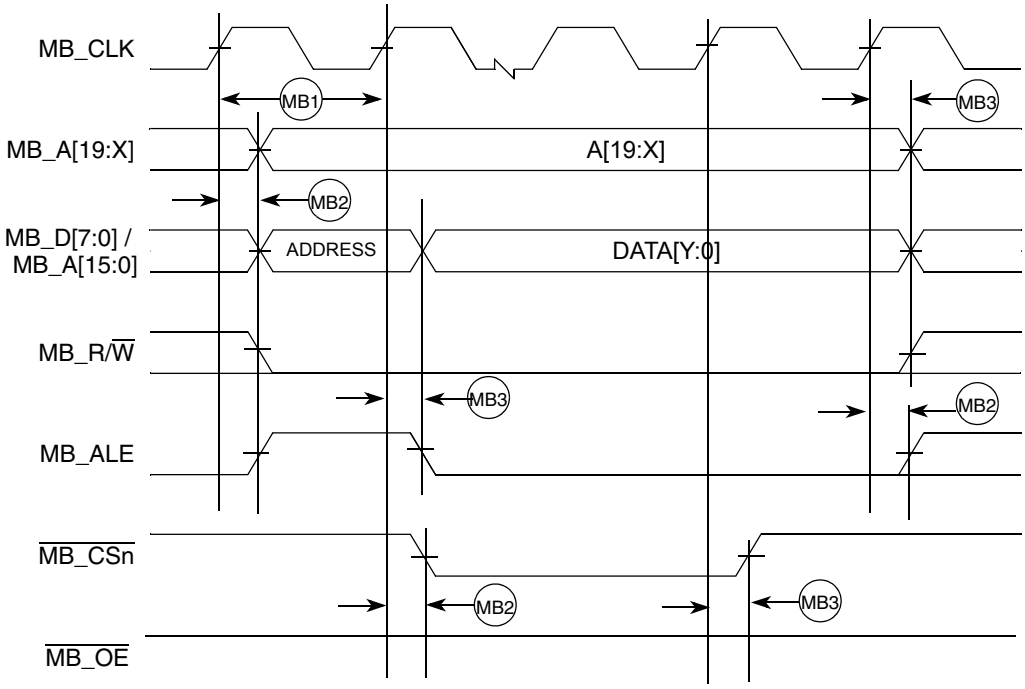

Figure 6. Mini-FlexBus Write Timing

2.11 Fast Ethernet Timing Specifications

The following timing specs are defined at the chip I/O pin and must be translated appropriately to arrive at timing specs/constraints for the physical interface.

2.11.3 Asynchronous Input Signal Timing Specifications

Table 19. MII Transmit Signal Timing

Num	Characteristic	Min	Max	Unit
E9	CRS, COL minimum pulse width	1.5	—	TXCLK period

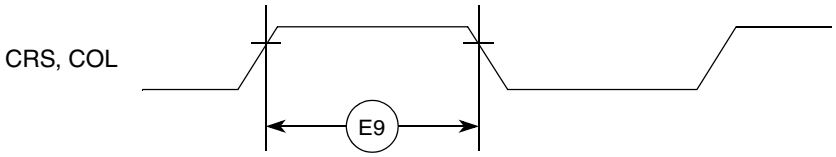

Figure 9. MII Async Inputs Timing Diagram

2.11.4 MII Serial Management Timing Specifications

Table 20. MII Serial Management Channel Signal Timing

Num	Characteristic	Symbol	Min	Max	Unit
E10	MDC cycle time	t_{MDC}	400	—	ns
E11	MDC pulse width		40	60	% t_{MDC}
E12	MDC to MDIO output valid		—	375	ns
E13	MDC to MDIO output invalid		25	—	ns
E14	MDIO input to MDC setup		10	—	ns
E15	MDIO input to MDC hold		0	—	ns

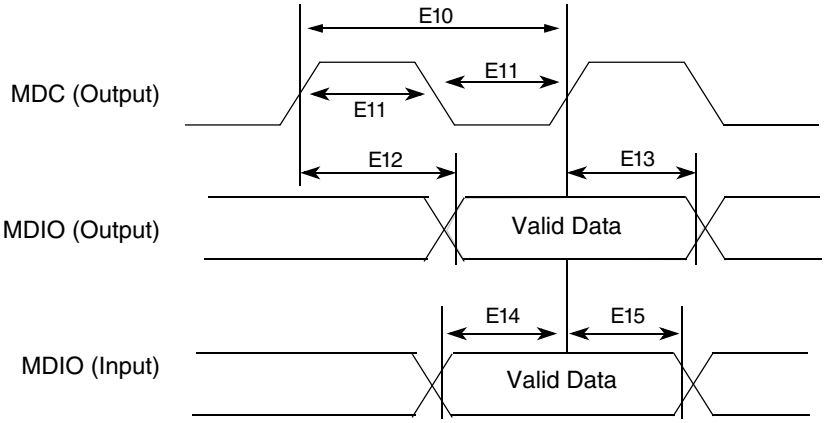

Figure 10. MII Serial Management Channel TIming Diagram

2.12 General Purpose I/O Timing

GPIO can be configured for certain pins of the QSPI, DDR Control, timer, UART, Interrupt and USB interfaces. When in GPIO mode, the timing specification for these pins is given in Table 21 and Figure 11.

The GPIO timing is met under the following load test conditions:

- 50 pF / 50 Ω for high drive

Table 28. JTAG and Boundary Scan Timing

Num	Characteristics[1]	Symbol	Min	Max	Unit
J1	TCLK frequency of operation	f_{JCYC}	DC	1/4	$f_{sys/2}$
J2	TCLK cycle period	t_{JCYC}	$4 \times t_{CYC}$	—	ns
J3	TCLK clock pulse width	t_{JCW}	26	—	ns
J4	TCLK rise and fall times	t_{JCRF}	0	3	ns
J5	Boundary scan input data setup time to TCLK rise	t_{BSDST}	4	—	ns
J6	Boundary scan input data hold time after TCLK rise	t_{BSDHT}	26	—	ns
J7	TCLK low to boundary scan output data valid	t_{BSDV}	0	33	ns
J8	TCLK low to boundary scan output high Z	t_{BSDZ}	0	33	ns
J9	TMS, TDI input data setup time to TCLK rise	t_{TAPBST}	4	—	ns
J10	TMS, TDI Input data hold time after TCLK rise	t_{TAPBHT}	10	—	ns
J11	TCLK low to TDO data valid	t_{TDODV}	0	26	ns
J12	TCLK low to TDO high Z	t_{TDODZ}	0	8	ns
J13	$\overline{\text{TRST}}$ assert time	t_{TRSTAT}	100	—	ns
J14	$\overline{\text{TRST}}$ setup time (negation) to TCLK high	t_{TRSTST}	10	—	ns

[1] JTAG_EN is expected to be a static signal. Hence, it is not associated with any timing.

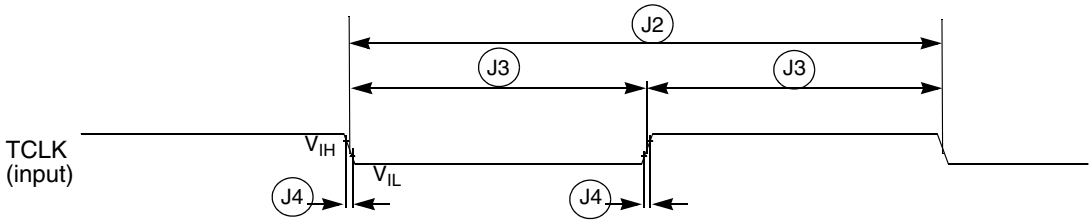

Figure 16. Test Clock Input Timing

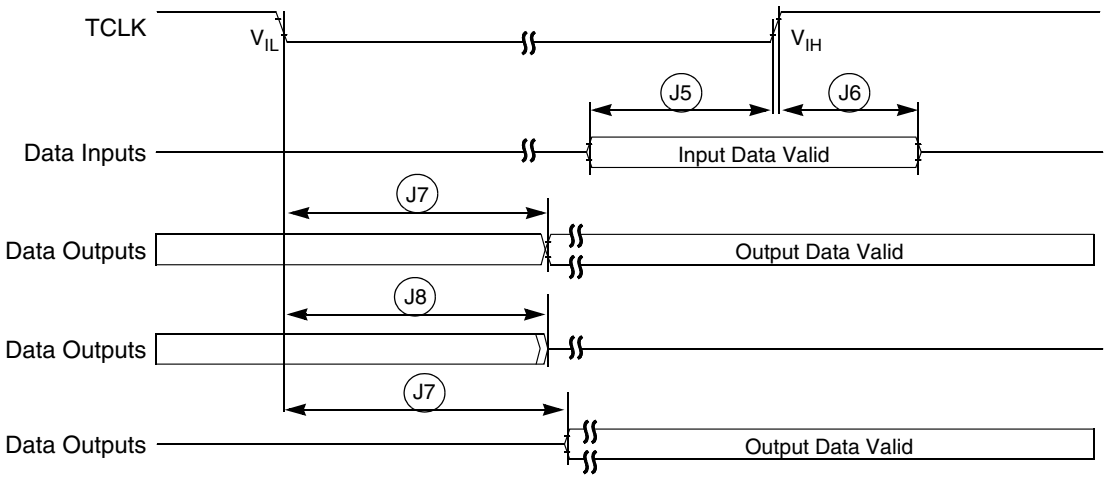

Figure 17. Boundary Scan (JTAG) Timing

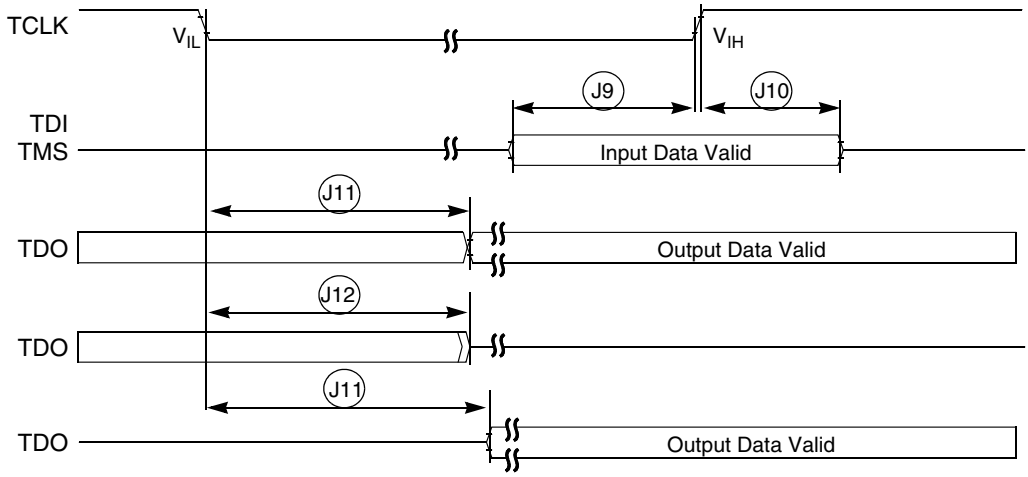

Figure 18. Test Access Port Timing

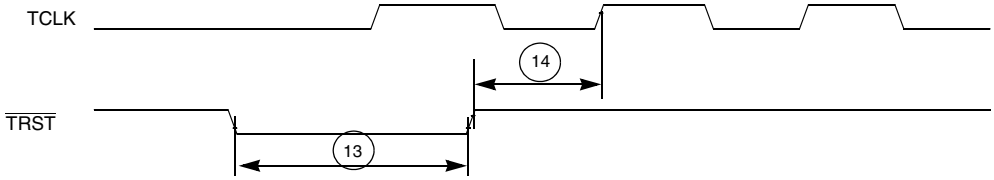

Figure 19. $\overline{TRST}$ Timing

2.20 Debug AC Timing Specifications

Table 29 lists specifications for the debug AC timing parameters shown in Figure 21.

Table 29. Debug AC Timing Specification

Num	Characteristic	66/80 MHz		Units
		Min	Max	
D1	PST, DDATA to CLKOUT setup	4	—	ns
D2	CLKOUT to PST, DDATA hold	1.5	—	ns
D3	DSI-to-DSCLK setup	$1 \times t_{CYC}$	—	ns
D4[1]	DSCLK-to-DSO hold	$4 \times t_{CYC}$	—	ns
D5	DSCLK cycle time	$5 \times t_{CYC}$	—	ns
D6	$\overline{\text{BKPT}}$ input data setup time to CLKOUT rise	4	—	ns
D7	$\overline{\text{BKPT}}$ input data hold time to CLKOUT rise	1.5	—	ns
D8	CLKOUT high to $\overline{\text{BKPT}}$ high Z	0.0	10.0	ns

1 DSCLK and DSI are synchronized internally. D4 is measured from the synchronized DSCLK input relative to the rising edge of CLKOUT.

Figure 20 shows real-time trace timing for the values in Table 29.

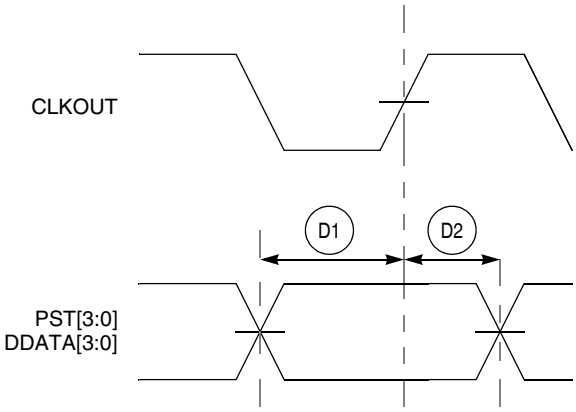

Figure 20. Real-Time Trace AC Timing
