### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### Details

Product Status	Active
Number of LABs/CLBs	7911
Number of Logic Elements/Cells	101261
Total RAM Bits	4939776
Number of I/O	480
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	676-BGA
Supplier Device Package	676-FBGA (27x27)

**Notes:**

- Stresses beyond those listed under Absolute Maximum Ratings might cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under Operating Conditions is not implied. Exposure to Absolute Maximum Ratings conditions for extended periods of time might affect device reliability.
- When programming eFUSE,  $V_{FS} \leq V_{CCAUX}$ . Requires up to 40 mA current. For read mode,  $V_{FS}$  can be between GND and 3.45 V.
- I/O absolute maximum limit applied to DC and AC signals. Overshoot duration is the percentage of a data period that the I/O is stressed beyond 3.45V.
- For I/O operation, refer to [UG381: Spartan-6 FPGA SelectIO Resources User Guide](#).
- Maximum percent overshoot duration to meet 4.40V maximum.
- For soldering guidelines and thermal considerations, see [UG385: Spartan-6 FPGA Packaging and Pinout Specification](#).

Table 5: Typical Quiescent Supply Current (Cont'd)

		LX100	9.0	9.0	9.0	9.0	mA
		LX100T	9.0	9.0	9.0	N/A	mA
		LX150	12.0	12.0	12.0	12.0	mA
		LX150T	12.0	12.0	12.0	N/A	mA

**Notes:**

1. Typical values are specified at nominal voltage, 25°C junction temperatures ( $T_j$ ). Industrial (I) grade devices have the same typical values as commercial (C) grade devices at 25°C, but higher values at 100°C. Use the XPE tool to calculate 100°C values. Nominal  $V_{CCINT}$  is 1.20V; use the XPE tool to calculate 1.23V values for the nominal  $V_{CCINT}$  of the extended performance range.
2. Typical values are for blank configured devices with no output current loads, no active input pull-up resistors, all I/O pins are 3-state and floating.
3. If differential signaling is used, more accurate quiescent current estimates can be obtained by using the XPOWER Estimator (XPE) or XPOWER Analyzer (XPA) tools.

Table 6: Power Supply Ramp Time

Symbol	Description	Speed Grade	Ramp Time	Units
$V_{CCINTR}$	Internal supply voltage ramp time	-3, -3N, -2	0.20 to 50.0	ms
		-1L	0.20 to 40.0	ms
$V_{CCO2}$ <sup>(1)</sup>	Output drivers bank 2 supply voltage ramp time	All	0.20 to 50.0	ms
$V_{CCAU}$	Auxiliary supply voltage ramp time	All	0.20 to 50.0	ms

**Notes:**

1. The minimum  $V_{CCO2}$  for power-on reset and configuration is 1.65V.
2. Spartan-6 FPGAs require a certain amount of supply current during power-on to insure proper device initialization. The actual current consumed depends on the power-on ramp rate of the power supply. Use the XPOWER Estimator (XPE) or XPOWER Analyzer (XPA) tools to estimate current drain on these supplies. Spartan-6 devices do not have a required power-on sequence.

In [Table 9](#) and [Table 10](#), values for  $V_{IL}$  and  $V_{IH}$  are recommended input voltages. Values for  $I_{OL}$  and  $I_{OH}$  are guaranteed over the recommended operating conditions at the  $V_{OL}$  and  $V_{OH}$  test points. Only selected standards are tested. These are chosen to ensure that all standards meet their specifications. The selected standards are tested at a minimum  $V_{CCO}$  with the respective  $V_{OL}$  and  $V_{OH}$  voltage levels shown. Other standards are sample tested.

## Notes:

1. Using same REFCLK input with TXENPMAPHASEALIGN enabled for up to four consecutive GTP transceiver sites.  
 2. Using PLL\_DIVSEL\_FB = 2, INTDATAWIDTH = 1. These values are NOT intended for protocol specific compliance determinations.

## Performance Characteristics

This section provides the performance characteristics of some common functions and designs implemented in Spartan-6 devices. The numbers reported here are worst-case values; they have all been fully characterized. These values are subject to the same guidelines as the [Switching Characteristics, page 19](#).

## Switching Characteristics

All values represented in this data sheet are based on these speed specifications: v1.20 for -3, -3N, and -2; and v1.08 for -1L. Switching characteristics are specified on a per-speed-grade basis and can be designated as Advance, Preliminary, or Production. Each designation is defined as follows:

### Advance

These specifications are based on simulations only and are typically available soon after device design specifications are frozen. Although speed grades with this designation are considered relatively stable and conservative, some under-reporting might still occur.

### Preliminary

These specifications are based on complete ES (engineering sample) silicon characterization. Devices and speed grades with this designation are intended to give a better indication of the expected performance of production silicon. The probability of under-reporting delays is greatly reduced as compared to Advance data.

### Production

These specifications are released once enough production silicon of a particular device family member has been characterized to provide full correlation between specifications and devices over numerous production lots. There is no under-reporting of delays, and customers receive formal notification of any subsequent changes. Typically, the slowest speed grades transition to Production before faster speed grades.

All specifications are always representative of worst-case supply voltage and junction temperature conditions.

Since individual family members are produced at different times, the migration from one category to another depends completely on the status of the fabrication process for each device.

The -1L speed grade refers to the lower-power Spartan-6 devices. The -3N speed grade refers to the Spartan-6 devices that do not support MCB functionality.

**Table 26** correlates the current status of each Spartan-6 device on a per speed grade basis.

## Testing of Switching Characteristics

All devices are 100% functionally tested. Internal timing parameters are derived from measuring internal test patterns. Listed below are representative values.

For more specific, more precise, and worst-case guaranteed data, use the values reported by the static timing analyzer and back-annotate to the simulation net list. Unless otherwise noted, values apply to all Spartan-6 devices.

**Notes:**

1. Delay depends on IODELAY2 tap setting. See TRACE report for actual values.
2. Maximum delay = integer (number of taps/8) × T<sub>TAP8</sub> + T<sub>TAPn</sub> (where n equals the remainder). For minimum delay consult the TRACE setup and hold report. Minimum delay is typically greater than 30% of the maximum delay. Tap delays can vary by device and overall conditions. See TRACE report for actual values.
3. Spartan-6 -1L devices only support tap 0. See TRACE report for actual values.

CLKFB_DELAY_VAR_EXT	Allowable variation of the off-chip feedback delay from the DCM output to the CLKFB input.	–	±1	–	±1	–	±1	–	±1	ns	

### Notes:

1. DLL specifications apply when using any of the DLL outputs: CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, or CLKDV.
2. When operating independently of the DLL, the DFS supports lower CLKIN\_FREQ\_DLL frequencies. See Table 55.
3. The CLKIN\_DIVIDE\_BY\_2 attribute increases the effective input frequency range. When set to TRUE, the input clock frequency is divided by two as it enters the DCM. Input clock frequencies for the clock buffer being used can be increased up to the F<sub>MAX</sub> (see Table 48 and Table 49 for BUFG and BUFIO2 limits). When used with CLK\_FEEDBACK=2X, the input clock frequency matches the frequency for CLK2X, and is limited to CLKOUT\_FREQ\_2X.
4. CLKIN\_FREQ\_DLL input jitter beyond these limits can cause the DCM to lose LOCK, indicated by the LOCKED output deasserting. The user must then reset the DCM.
5. When using both DCMs in a CMT, both DCMs must be LOCKED.

Table 54: Switching Characteristics for the Delay-Locked Loop (DLL)<sup>(1)</sup> (Cont'd)

Symbol	Description	Speed Grade								Units	
		-3		-3N		-2		-1L			
		Min	Max	Min	Max	Min	Max	Min	Max		
LOCK_DLL <sup>(3)</sup>	When using the DLL alone: The time from deassertion at the DCM's reset input to the rising transition at its LOCKED output. When the DCM is locked, the CLKIN and CLKFB signals are in phase. CLKIN_FREQ_DLL < 50 MHz.	—	5	—	5	—	5	—	5	ms	
	When using the DLL alone: The time from deassertion at the DCM's reset input to the rising transition at its LOCKED output. When the DCM is locked, the CLKIN and CLKFB signals are in phase. CLKIN_FREQ_DLL > 50 MHz.	—	0.60	—	0.60	—	0.60	—	0.60	ms	
<b>Delay Lines</b>											
DCM_DELAY_STEP <sup>(5)</sup>	Finest delay resolution, averaged over all steps.	10	40	10	40	10	40	10	40	ps	

**Notes:**

- The values in this table are based on the operating conditions described in Table 2 and Table 53.
- Indicates the maximum amount of output jitter that the DCM adds to the jitter on the CLKIN input.
- For optimal jitter tolerance and faster LOCK time, use the CLKIN\_PERIOD attribute.
- Some jitter and duty-cycle specifications include 1% of input clock period or 0.01 UI. For example, this data sheet specifies a maximum jitter of  $\pm(1\% \text{ of CLKIN period} + 150 \text{ ps})$ . Assuming that the CLKIN frequency is 100 MHz, the equivalent CLKIN period is 10 ns. Since 1% of 10 ns is 0.1 ns or 100 ps, the maximum jitter is  $\pm(100 \text{ ps} + 150 \text{ ps}) = \pm250 \text{ ps}$ .
- A typical delay step size is 23 ps.
- The timing analysis tools use the CLK\_FEEDBACK = 1X condition for the CLKIN\_CLKFB\_PHASE value (reported as phase error). When using CLK\_FEEDBACK = 2X, add 100 ps to the phase error for the CLKIN\_CLKFB\_PHASE value (as shown in this table).

CLKIN_CYC_JITT_FX_HF	Cycle-to-cycle jitter at the CLKIN input, based on CLKFX output frequency: F <sub>CLKFX</sub> > 150 MHz.	—	$\pm 150$	—	$\pm 150$	—	$\pm 150$	—	$\pm 150$	ps	
CLKIN_PER_JITT_FX	Period jitter at the CLKIN input.	—	$\pm 1$	—	$\pm 1$	—	$\pm 1$	—	$\pm 1$	ns	

**Notes:**

- DFS specifications apply when using either of the DFS outputs (CLKFX or CLKFX180).
- When using both DFS and DLL outputs on the same DCM, follow the more restrictive CLKIN\_FREQ\_DLL specifications in Table 53.
- The CLKIN\_DIVIDE\_BY\_2 attribute increases the effective input frequency range. When set to TRUE, the input clock frequency is divided by two as it enters the DCM. Input clock frequencies for the clock buffer being used can be increased up to the F<sub>MAX</sub> (see Table 48 and Table 49 for BUFG and BUFI02 limits).
- CLKIN input jitter beyond these limits can cause the DCM to lose LOCK.

	When FCLKIN > 50 MHz, the time from deassertion at the DCM's reset input to the rising transition at its LOCKED output. The DFS asserts LOCKED when the CLKFX and CLKFX180 signals are valid. When using both the DLL and the DFS, use the longer locking time.	–	0.45	–	0.45	–	0.45	–	0.60	ms	

**Notes:**

- The values in this table are based on the operating conditions described in Table 2 and Table 55.
- For optimal jitter tolerance and a faster LOCK time, use the CLKIN\_PERIOD attribute.
- Output jitter is characterized with no input jitter. Output jitter strongly depends on the environment, including the number of SSOs, the output drive strength, CLB utilization, CLB switching activities, switching frequency, power supply, and PCB design. The actual maximum output jitter depends on the system application.
- The CLKFX, CLKFXDV, and CLKFX180 outputs have a duty cycle of approximately 50%.
- Some duty cycle and alignment specifications include a percentage of the CLKFX output period. For example, this data sheet specifies a maximum CLKFX jitter of ±(1% of CLKFX period + 200 ps). Assuming that the CLKFX output frequency is 100 MHz, the equivalent CLKFX period is 10 ns, and 1% of 10 ns is 0.1 ns or 100 ps. Accordingly, the maximum jitter is ±(100 ps + 200 ps) = ±300 ps.

Table 59: Switching Characteristics for the Phase-Shift Clock in Variable Phase Mode<sup>(1)</sup>

Symbol	Description	Amount of Phase Shift	Units
<b>Phase Shifting Range</b>			
MAX_STEPS <sup>(2)</sup>	When CLKIN < 60 MHz, the maximum allowed number of DCM_DELAY_STEP steps for a given CLKIN clock period, where T = CLKIN clock period in ns. When using CLKIN_DIVIDE_BY_2 = TRUE, double the clock-effective clock period.	$\pm(\text{INTEGER}(10 \times (\text{CLKIN} - 3 \text{ ns})))$	steps
	When CLKIN $\geq$ 60 MHz, the maximum allowed number of DCM_DELAY_STEP steps for a given CLKIN clock period, where T = CLKIN clock period in ns. When using CLKIN_DIVIDE_BY_2 = TRUE, double the clock-effective clock period.	$\pm(\text{INTEGER}(15 \times (\text{CLKIN} - 3 \text{ ns})))$	steps
FINE_SHIFT_RANGE_MIN	Minimum guaranteed delay for variable phase shifting.	$\pm(\text{MAX_STEPS} \times \text{DCM_DELAY_STEP_MIN})$	ps
FINE_SHIFT_RANGE_MAX	Maximum guaranteed delay for variable phase shifting	$\pm(\text{MAX_STEPS} \times \text{DCM_DELAY_STEP_MAX})$	ps

**Notes:**

- The values in this table are based on the operating conditions described in Table 53 and Table 58.
- The maximum variable phase shift range, MAX\_STEPS, is only valid when the DCM has no initial fixed-phase shifting, that is, the PHASE\_SHIFT attribute is set to 0.
- The DCM\_DELAY\_STEP values are provided at the end of Table 54.

**Notes:**

1. Setup and Hold times are measured over worst case conditions (process, voltage, temperature). Setup time is measured relative to the Global Clock input signal using the slowest process, highest temperature, and lowest voltage. Hold time is measured relative to the Global Clock input signal using the fastest process, lowest temperature, and highest voltage. These measurements include CMT jitter; DCM CLK0 driving PLL, PLL CLKOUT0 driving BUFG.
2. IFF = Input Flip-Flop or Latch
3. Use IBIS to determine any duty-cycle distortion incurred using various standards.

## Source-Synchronous Switching Characteristics

The parameters in this section provide the necessary values for calculating timing budgets for Spartan-6 FPGA source-synchronous transmitter and receiver data-valid windows.
