### **Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

**Notes:**

1. SSO limits greater than the number of I/O per V<sub>CCO</sub>/GND pair (Table 33) indicate No Limit for the given I/O standard. They are provided in this table to calculate limits when using multiple I/O standards in a bank.
2. Not available (N/A) indicates that the I/O standard is not available in the given bank.
3. When used with the MCB, these signals are exempt from SSO analysis due to the known activity of the MCB switching patterns. SSO performance is validated for all MCB instances. MCB outputs can, in some cases, exceed the SSO limits.

CLKIN_CYC_JITT_DLL_HF	Cycle-to-cycle jitter at the CLKIN input for CLKIN_FREQ_DLL > 150 MHz.	–	±150	–	±150	–	±150	–	±150	ps	
CLKIN_PER_JITT_DLL	Period jitter at the CLKIN input.	–	±1	–	±1	–	±1	–	±1	ns	
CLKFB_DELAY_VAR_EXT	Allowable variation of the off-chip feedback delay from the DCM output to the CLKFB input.	–	±1	–	±1	–	±1	–	±1	ns	

### Notes:

1. DLL specifications apply when using any of the DLL outputs: CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, or CLKDV.
2. When operating independently of the DLL, the DFS supports lower CLKIN\_FREQ\_DLL frequencies. See Table 55.
3. The CLKIN\_DIVIDE\_BY\_2 attribute increases the effective input frequency range. When set to TRUE, the input clock frequency is divided by two as it enters the DCM. Input clock frequencies for the clock buffer being used can be increased up to the F<sub>MAX</sub> (see Table 48 and Table 49 for BUFG and BUFIO2 limits). When used with CLK\_FEEDBACK=2X, the input clock frequency matches the frequency for CLK2X, and is limited to CLKOUT\_FREQ\_2X.
4. CLKIN\_FREQ\_DLL input jitter beyond these limits can cause the DCM to lose LOCK, indicated by the LOCKED output deasserting. The user must then reset the DCM.
5. When using both DCMs in a CMT, both DCMs must be LOCKED.

LOCK_DLL <sup>(3)</sup>	When using the DLL alone: The time from deassertion at the DCM's reset input to the rising transition at its LOCKED output. When the DCM is locked, the CLKIN and CLKFB signals are in phase. CLKIN_FREQ_DLL < 50 MHz.	—	5	—	5	—	5	—	5	ms	
	When using the DLL alone: The time from deassertion at the DCM's reset input to the rising transition at its LOCKED output. When the DCM is locked, the CLKIN and CLKFB signals are in phase. CLKIN_FREQ_DLL > 50 MHz.	—	0.60	—	0.60	—	0.60	—	0.60	ms	
<b>Delay Lines</b>											
DCM_DELAY_STEP <sup>(5)</sup>	Finest delay resolution, averaged over all steps.	10	40	10	40	10	40	10	40	ps	

**Notes:**

- The values in this table are based on the operating conditions described in Table 2 and Table 53.
- Indicates the maximum amount of output jitter that the DCM adds to the jitter on the CLKIN input.
- For optimal jitter tolerance and faster LOCK time, use the CLKIN\_PERIOD attribute.
- Some jitter and duty-cycle specifications include 1% of input clock period or 0.01 UI. For example, this data sheet specifies a maximum jitter of  $\pm(1\% \text{ of CLKIN period} + 150 \text{ ps})$ . Assuming that the CLKIN frequency is 100 MHz, the equivalent CLKIN period is 10 ns. Since 1% of 10 ns is 0.1 ns or 100 ps, the maximum jitter is  $\pm(100 \text{ ps} + 150 \text{ ps}) = \pm250 \text{ ps}$ .
- A typical delay step size is 23 ps.
- The timing analysis tools use the CLK\_FEEDBACK = 1X condition for the CLKIN\_CLKFB\_PHASE value (reported as phase error). When using CLK\_FEEDBACK = 2X, add 100 ps to the phase error for the CLKIN\_CLKFB\_PHASE value (as shown in this table).

**Notes:**

- DFS specifications apply when using either of the DFS outputs (CLKFX or CLKFX180).
- When using both DFS and DLL outputs on the same DCM, follow the more restrictive CLKIN\_FREQ\_DLL specifications in Table 53.
- The CLKIN\_DIVIDE\_BY\_2 attribute increases the effective input frequency range. When set to TRUE, the input clock frequency is divided by two as it enters the DCM. Input clock frequencies for the clock buffer being used can be increased up to the F<sub>MAX</sub> (see Table 48 and Table 49 for BUFG and BUFI02 limits).
- CLKIN input jitter beyond these limits can cause the DCM to lose LOCK.

Hold time is measured relative to the Global Clock input signal using the fastest process, lowest temperature, and highest voltage.
2. IFF = Input Flip-Flop or Latch.
