Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Notes:

- Stresses beyond those listed under Absolute Maximum Ratings might cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under Operating Conditions is not implied. Exposure to Absolute Maximum Ratings conditions for extended periods of time might affect device reliability.
- When programming eFUSE, $V_{FS} \leq V_{CCAUX}$. Requires up to 40 mA current. For read mode, V_{FS} can be between GND and 3.45 V.
- I/O absolute maximum limit applied to DC and AC signals. Overshoot duration is the percentage of a data period that the I/O is stressed beyond 3.45V.
- For I/O operation, refer to [UG381](#): *Spartan-6 FPGA SelectIO Resources User Guide*.
- Maximum percent overshoot duration to meet 4.40V maximum.
- For soldering guidelines and thermal considerations, see [UG385](#): *Spartan-6 FPGA Packaging and Pinout Specification*.

Quiescent Current

Typical values for quiescent supply current are specified at nominal voltage, 25°C junction temperatures (T_j). Quiescent supply current is specified by speed grade for Spartan-6 devices. Xilinx recommends analyzing static power consumption using the XPOWER™ Estimator (XPE) tool (download at <http://www.xilinx.com/power>) for conditions other than those specified in Table 5.

		LX150T	12.0	12.0	12.0	N/A	mA

Notes:

- Typical values are specified at nominal voltage, 25°C junction temperatures (T_j). Industrial (I) grade devices have the same typical values as commercial (C) grade devices at 25°C, but higher values at 100°C. Use the XPE tool to calculate 100°C values. Nominal V_{CCINT} is 1.20V; use the XPE tool to calculate 1.23V values for the nominal V_{CCINT} of the extended performance range.
- Typical values are for blank configured devices with no output current loads, no active input pull-up resistors, all I/O pins are 3-state and floating.
- If differential signaling is used, more accurate quiescent current estimates can be obtained by using the XPOWER Estimator (XPE) or XPOWER Analyzer (XPA) tools.

Table 6: Power Supply Ramp Time

Symbol	Description	Speed Grade	Ramp Time	Units
V _{CCINTR}	Internal supply voltage ramp time	-3, -3N, -2	0.20 to 50.0	ms
		-1L	0.20 to 40.0	ms
V _{CCO2} ⁽¹⁾	Output drivers bank 2 supply voltage ramp time	All	0.20 to 50.0	ms
V _{CCAUXR}	Auxiliary supply voltage ramp time	All	0.20 to 50.0	ms

Notes:

- The minimum V_{CCO2} for power-on reset and configuration is 1.65V.
- Spartan-6 FPGAs require a certain amount of supply current during power-on to insure proper device initialization. The actual current consumed depends on the power-on ramp rate of the power supply. Use the XPOWER Estimator (XPE) or XPOWER Analyzer (XPA) tools to estimate current drain on these supplies. Spartan-6 devices do not have a required power-on sequence.

Production Silicon and ISE Software Status

In some cases, a particular family member (and speed grade) is released to production before a speed specification is released with the correct label (Advance, Preliminary, Production). Any labeling discrepancies are corrected in subsequent speed specification releases. [Table 27](#) lists the production released Spartan-6 family member, speed grade, and the minimum corresponding supported speed specification version and ISE® software revisions. The ISE software and speed specifications listed are the minimum releases required for production. All subsequent releases of software and speed specifications are valid.

3. Input voltage level from which measurement starts.
4. This is an input voltage reference that bears no relation to the V_{REF} / V_{MEAS} parameters found in IBIS models and/or noted in Figure 4.
5. The value given is the differential input voltage.

Notes:

- SSO limits greater than the number of I/O per V_{CCO}/GND pair (Table 33) indicate No Limit for the given I/O standard. They are provided in this table to calculate limits when using multiple I/O standards in a bank.
- Not available (N/A) indicates that the I/O standard is not available in the given bank.
- When used with the MCB, these signals are exempt from SSO analysis due to the known activity of the MCB switching patterns. SSO performance is validated for all MCB instances. MCB outputs can, in some cases, exceed the SSO limits.

Notes:

- Maximum frequency and setup/hold timing parameters are for 3.3V and 2.5V configuration voltages.
- To support longer delays in configuration, use the design solutions described in [UG380: Spartan-6 FPGA Configuration User Guide](#).
- [Table 6](#) specifies the power supply ramp time.
- BPI mode is not supported in:
 - LX4, LX25, or LX25T devices
 - LX9 devices in the TQG144 package
 - LX9 or LX16 devices in the CPG196 package.
- Only during configuration, the last edge is determined by a weak pull-up/pull-down resistor in the I/O.
- Defense-grade Spartan-6Q -2Q devices configure in single default SPI Master (x1) mode at $T_j = -55^{\circ}\text{C}$. During operation and when using all other configuration functions, the minimum operating temperature is -40°C .

Notes:

1. Setup and Hold times are measured over worst case conditions (process, voltage, temperature). Setup time is measured relative to the Global Clock input signal using the slowest process, highest temperature, and lowest voltage. Hold time is measured relative to the Global Clock input signal using the fastest process, lowest temperature, and highest voltage. These measurements include PLL CLKOUT0 jitter.
2. IFF = Input Flip-Flop or Latch
3. Use IBIS to determine any duty-cycle distortion incurred using various standards.

- Setup and Hold times are measured over worst case conditions (process, voltage, temperature). Setup time is measured relative to the Global Clock input signal using the slowest process, highest temperature, and lowest voltage. Hold time is measured relative to the Global Clock input signal using the fastest process, lowest temperature, and highest voltage. The timing values were measured using the fine-phase adjustment feature of the DCM. These measurements include CMT jitter; DCM CLK0 driving PLL, PLL CLKOUT0 driving BUFG. Package skew is not included in these measurements.
- IFF = Input Flip-Flop

Notes:

- These values represent the worst-case skew between any two SelectIO resources in the package: shortest delay to longest delay from Pad to Ball.
- Some of the devices are available in both Pb and Pb-free (additional G) packages as standard ordering options. See [DS160: Spartan-6 Family Overview](#) for more information.

Notes:

- LXT devices are not available with a -1L speed grade.
- This parameter indicates the total sampling error of Spartan-6 FPGA DDR input registers, measured across voltage, temperature, and process. The characterization methodology uses the DCM to capture the DDR input registers' edges of operation. These measurements include:
 - CLK0 DCM jitter
 - DCM accuracy (phase offset)
 - DCM phase shift resolution
These measurements do not include package or clock tree skew.
- This parameter indicates the total sampling error of Spartan-6 FPGA DDR input registers, measured across voltage, temperature, and process. The characterization methodology uses the BUFIO2 clock network and IODELAY2 to capture the DDR input registers' edges of operation. These measurements do not include package or clock tree skew.
