### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

## Production Silicon and ISE Software Status

In some cases, a particular family member (and speed grade) is released to production before a speed specification is released with the correct label (Advance, Preliminary, Production). Any labeling discrepancies are corrected in subsequent speed specification releases. [Table 27](#) lists the production released Spartan-6 family member, speed grade, and the minimum corresponding supported speed specification version and ISE® software revisions. The ISE software and speed specifications listed are the minimum releases required for production. All subsequent releases of software and speed specifications are valid.

**Notes:**

1. Maximum frequency and setup/hold timing parameters are for 3.3V and 2.5V configuration voltages.
2. To support longer delays in configuration, use the design solutions described in [UG380: Spartan-6 FPGA Configuration User Guide](#).
3. [Table 6](#) specifies the power supply ramp time.
4. BPI mode is not supported in:
  - LX4, LX25, or LX25T devices
  - LX9 devices in the TQG144 package
  - LX9 or LX16 devices in the CPG196 package.
5. Only during configuration, the last edge is determined by a weak pull-up/pull-down resistor in the I/O.
6. Defense-grade Spartan-6Q -2Q devices configure in single default SPI Master (x1) mode at  $T_j = -55^{\circ}\text{C}$ . During operation and when using all other configuration functions, the minimum operating temperature is  $-40^{\circ}\text{C}$ .

**Notes:**

- The values in this table are based on the operating conditions described in Table 2 and Table 55.
- For optimal jitter tolerance and a faster LOCK time, use the CLKIN\_PERIOD attribute.
- Output jitter is characterized with no input jitter. Output jitter strongly depends on the environment, including the number of SSOs, the output drive strength, CLB utilization, CLB switching activities, switching frequency, power supply, and PCB design. The actual maximum output jitter depends on the system application.
- The CLKFX, CLKFXDV, and CLKFX180 outputs have a duty cycle of approximately 50%.
- Some duty-cycle and alignment specifications include a percentage of the CLKFX output period. For example, this data sheet specifies a maximum CLKFX jitter of  $\pm(1\% \text{ of CLKFX period} + 200 \text{ ps})$ . Assuming that the CLKFX output frequency is 100 MHz, the equivalent CLKFX period is 10 ns, and 1% of 10 ns is 0.1 ns or 100 ps. Accordingly, the maximum jitter is  $\pm(100 \text{ ps} + 200 \text{ ps}) = \pm300 \text{ ps}$ .
- When using CENTER\_LOW\_SPREAD, CENTER\_HIGH\_SPREAD, the valid values for CLKFX\_MULTIPLY are limited to 2 through 32, and the valid values for CLKFX\_DIVIDE are limited to 1 through 4.
