Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Notes:

1. These specifications apply during programming of the eFUSE AES key. Programming is only supported through JTAG.The AES key is only supported in the following devices: LX75, LX75T, LX100, LX100T, LX150, and LX150T.
2. When programming eFUSE, V_{FS} must be less than or equal to V_{CCAUX}. When not programming or when eFUSE is not used, Xilinx recommends connecting V_{FS} to GND. However, V_{FS} can be between GND and 3.45 V.
3. An R_{FUSE} resistor is required when programming the eFUSE AES key. When not programming or when eFUSE is not used, Xilinx recommends connecting the R_{FUSE} pin to V_{CCAUX} or GND. However, R_{FUSE} can be unconnected.

Notes:

1. The values in this table are based on the operating conditions described in Table 2 and Table 55.
2. For optimal jitter tolerance and a faster LOCK time, use the CLKIN_PERIOD attribute.
3. Output jitter is characterized with no input jitter. Output jitter strongly depends on the environment, including the number of SSOs, the output drive strength, CLB utilization, CLB switching activities, switching frequency, power supply, and PCB design. The actual maximum output jitter depends on the system application.
4. The CLKFX, CLKFXDV, and CLKFX180 outputs have a duty cycle of approximately 50%.
5. Some duty cycle and alignment specifications include a percentage of the CLKFX output period. For example, this data sheet specifies a maximum CLKFX jitter of ±(1% of CLKFX period + 200 ps). Assuming that the CLKFX output frequency is 100 MHz, the equivalent CLKFX period is 10 ns, and 1% of 10 ns is 0.1 ns or 100 ps. Accordingly, the maximum jitter is ±(100 ps + 200 ps) = ±300 ps.

Notes:

1. Setup and Hold times are measured over worst case conditions (process, voltage, temperature). Setup time is measured relative to the Global Clock input signal using the slowest process, highest temperature, and lowest voltage. Hold time is measured relative to the Global Clock input signal using the fastest process, lowest temperature, and highest voltage. These measurements include CMT jitter; DCM CLK0 driving PLL, PLL CLKOUT0 driving BUFG.
2. IFF = Input Flip-Flop or Latch
3. Use IBIS to determine any duty-cycle distortion incurred using various standards.

1. LXT devices are not available with a -1L speed grade.
2. This parameter indicates the total sampling error of Spartan-6 FPGA DDR input registers, measured across voltage, temperature, and process. The characterization methodology uses the DCM to capture the DDR input registers' edges of operation. These measurements include:
   - CLK0 DCM jitter
   - DCM accuracy (phase offset)
   - DCM phase shift resolution

   These measurements do not include package or clock tree skew.

The characterization methodology uses the BUFIO2 clock network and IODELAY2 to capture the DDR input registers' edges of operation. These measurements do not include package or clock tree skew.

Date	Version	Description of Revisions
09/14/11	2.4	Production release of the XA6SLX4 and XA6SLX9 devices in Table 26 and Table 27 using ISE v13.2 software with -2 and -3 speed specification v1.19. Added production released version of the XA6SLX100 to Table 26 and Table 27 using ISE v13.3 software with -2 speed specification v1.20. Updated R_{OUT_TERM} description in Table 4. Fixed the LVPECL V_H error in Table 31. Updated introduction in Simultaneously Switching Outputs. Added the XA6SLX100 to Table 63 through Table 78, and Table 81. Added Note 4 to Table 78 because the T_{CKSKEW} for the XC6SLX100 is not the same as the T_{CKSKEW} for the XA6SLX100. Revised the revision history for version 1.6 dated 06/24/10. Removed the parenthetical statement about the -3N speed grade: (specifications are identical to the -3 speed grade).
10/17/11	3.0	Changed the data sheet from Preliminary Product Specification to Product Specification. Updated the Switching Characteristics, page 19 speed specification version ISE v13.3 software to -2 and -3 speed specification v1.20 and -1L speed specification of v1.08. Also updated Note 1 in Table 27. In Table 43, *Block RAM Switching Characteristics*, the F_{MAX} value for the -2 speed grade has been changed from 260 MHz to 280 MHz. In Table 54, *Switching Characteristics for the DLL*, a Note 6 was added and linked to CLKIN_CLKFB_PHASE.
