Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Output Delay Measurements

Output delays are measured using a Tektronix P6245 TDS500/600 probe (< 1 pF) across approximately 4" of FR4 microstrip trace. Standard termination was used for all testing. The propagation delay of the 4" trace is characterized separately and subtracted from the final measurement, and is therefore not included in the generalized test setups shown in Figure 4 and Figure 5.

Figure 4: Single-Ended Test Setup

ds162_07_011309

Figure 5: Differential Test Setup

Measurements and test conditions are reflected in the IBIS models except where the IBIS format precludes it. Parameters V_{REF} , R_{REF} , C_{REF} , and V_{MEAS} fully describe the test conditions for each I/O standard. The most accurate prediction of propagation delay in any given application can be obtained through IBIS simulation, using the following method:

1. Simulate the output driver of choice into the generalized test setup, using values from Table 32.
2. Record the time to V_{MEAS} .
3. Simulate the output driver of choice into the actual PCB trace and load, using the appropriate IBIS model or capacitance value to represent the load.
4. Record the time to V_{MEAS} .
5. Compare the results of steps 2 and 4. The increase or decrease in delay yields the actual propagation delay of the PCB trace.

Notes:

- SSO limits greater than the number of I/O per V_{CCO}/GND pair (Table 33) indicate No Limit for the given I/O standard. They are provided in this table to calculate limits when using multiple I/O standards in a bank.
- Not available (N/A) indicates that the I/O standard is not available in the given bank.
- When used with the MCB, these signals are exempt from SSO analysis due to the known activity of the MCB switching patterns. SSO performance is validated for all MCB instances. MCB outputs can, in some cases, exceed the SSO limits.

Notes:

- Setup and Hold times are measured over worst case conditions (process, voltage, temperature). Setup time is measured relative to the Global Clock input signal using the slowest process, highest temperature, and lowest voltage. Hold time is measured relative to the Global Clock input signal using the fastest process, lowest temperature, and highest voltage.
- Default delay uses IODELAY2 tap 0.
- IFF = Input Flip-Flop or Latch.

Date	Version	Description of Revisions
09/14/11	2.4	Production release of the XA6SLX4 and XA6SLX9 devices in Table 26 and Table 27 using ISE v13.2 software with -2 and -3 speed specification v1.19. Added production released version of the XA6SLX100 to Table 26 and Table 27 using ISE v13.3 software with -2 speed specification v1.20. Updated R_{OUT_TERM} description in Table 4. Fixed the LVPECL V_H error in Table 31. Updated introduction in Simultaneously Switching Outputs. Added the XA6SLX100 to Table 63 through Table 78, and Table 81. Added Note 4 to Table 78 because the T_{CKSKEW} for the XC6SLX100 is not the same as the T_{CKSKEW} for the XA6SLX100. Revised the revision history for version 1.6 dated 06/24/10. Removed the parenthetical statement about the -3N speed grade: (specifications are identical to the -3 speed grade).
10/17/11	3.0	Changed the data sheet from Preliminary Product Specification to Product Specification. Updated the Switching Characteristics, page 19 speed specification version ISE v13.3 software to -2 and -3 speed specification v1.20 and -1L speed specification of v1.08. Also updated Note 1 in Table 27. In Table 43, <i>Block RAM Switching Characteristics</i>, the F_{MAX} value for the -2 speed grade has been changed from 260 MHz to 280 MHz. In Table 54, <i>Switching Characteristics for the DLL</i>, a Note 6 was added and linked to CLKIN_CLKFB_PHASE.
