### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

## Quiescent Current

Typical values for quiescent supply current are specified at nominal voltage, 25°C junction temperatures ( $T_j$ ). Quiescent supply current is specified by speed grade for Spartan-6 devices. Xilinx recommends analyzing static power consumption using the XPOWER™ Estimator (XPE) tool (download at <http://www.xilinx.com/power>) for conditions other than those specified in Table 5.

**Notes:**

1. LVPECL\_33 and TMDS\_33 maximum V<sub>ICM</sub> is the lower of V (maximum) or V<sub>CCAUX</sub> – (V<sub>ID</sub>/2)
2. When V<sub>CCAUX</sub> = 3.3V, the DCD can be higher than 5% for V<sub>ICM</sub> < 0.7V when using these I/O standards: LVDS\_25, LVDS\_33, BLVDS\_25, LVPECL\_25, LVPECL\_33, RSDS\_25, RSDS\_33, PPDS\_25, and PPDS\_33.
3. The -1L devices require V<sub>CCAUX</sub> = 2.5V when using the LVDS\_25, LVDS\_33, BLVDS\_25, LVPECL\_25, RSDS\_25, RSDS\_33, PPDS\_25, and PPDS\_33 I/O standards on inputs. LVPECL\_33 is not supported in the -1L devices.

## Switching Characteristics

All values represented in this data sheet are based on these speed specifications: v1.20 for -3, -3N, and -2; and v1.08 for -1L. Switching characteristics are specified on a per-speed-grade basis and can be designated as Advance, Preliminary, or Production. Each designation is defined as follows:

### Advance

These specifications are based on simulations only and are typically available soon after device design specifications are frozen. Although speed grades with this designation are considered relatively stable and conservative, some under-reporting might still occur.

### Preliminary

These specifications are based on complete ES (engineering sample) silicon characterization. Devices and speed grades with this designation are intended to give a better indication of the expected performance of production silicon. The probability of under-reporting delays is greatly reduced as compared to Advance data.

### Production

These specifications are released once enough production silicon of a particular device family member has been characterized to provide full correlation between specifications and devices over numerous production lots. There is no under-reporting of delays, and customers receive formal notification of any subsequent changes. Typically, the slowest speed grades transition to Production before faster speed grades.

All specifications are always representative of worst-case supply voltage and junction temperature conditions.

Since individual family members are produced at different times, the migration from one category to another depends completely on the status of the fabrication process for each device.

The -1L speed grade refers to the lower-power Spartan-6 devices. The -3N speed grade refers to the Spartan-6 devices that do not support MCB functionality.

**Table 26** correlates the current status of each Spartan-6 device on a per speed grade basis.

## Testing of Switching Characteristics

All devices are 100% functionally tested. Internal timing parameters are derived from measuring internal test patterns. Listed below are representative values.

For more specific, more precise, and worst-case guaranteed data, use the values reported by the static timing analyzer and back-annotate to the simulation net list. Unless otherwise noted, values apply to all Spartan-6 devices.

**Notes:**

1. The Spartan-6Q FPGA -1L values are listed in Table 28.

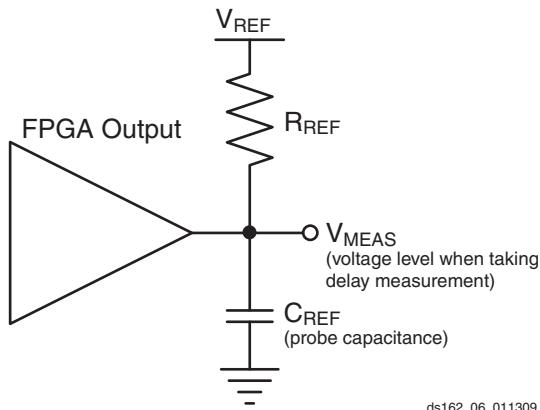

Table 30 summarizes the value of  $T_{IOTPHZ}$ .  $T_{IOTPHZ}$  is described as the delay from the T pin to the IOB pad through the output buffer of an IOB pad, when 3-state is enabled (i.e., a high impedance state). These delays are measured using LVCMOS25, Fast, 12 mA.

## Output Delay Measurements

Output delays are measured using a Tektronix P6245 TDS500/600 probe (<1 pF) across approximately 4" of FR4 microstrip trace. Standard termination was used for all testing. The propagation delay of the 4" trace is characterized separately and subtracted from the final measurement, and is therefore not included in the generalized test setups shown in [Figure 4](#) and [Figure 5](#).

[Figure 4: Single-Ended Test Setup](#)

[Figure 5: Differential Test Setup](#)

Measurements and test conditions are reflected in the IBIS models except where the IBIS format precludes it. Parameters  $V_{REF}$ ,  $R_{REF}$ ,  $C_{REF}$ , and  $V_{MEAS}$  fully describe the test conditions for each I/O standard. The most accurate prediction of propagation delay in any given application can be obtained through IBIS simulation, using the following method:

1. Simulate the output driver of choice into the generalized test setup, using values from [Table 32](#).
2. Record the time to  $V_{MEAS}$ .
3. Simulate the output driver of choice into the actual PCB trace and load, using the appropriate IBIS model or capacitance value to represent the load.
4. Record the time to  $V_{MEAS}$ .
5. Compare the results of steps 2 and 4. The increase or decrease in delay yields the actual propagation delay of the PCB trace.

- The values in this table are based on the operating conditions described in Table 53 and Table 58.
- The maximum variable phase shift range, MAX\_STEPS, is only valid when the DCM has no initial fixed-phase shifting, that is, the PHASE\_SHIFT attribute is set to 0.
- The DCM\_DELAY\_STEP values are provided at the end of Table 54.

**Notes:**

1. Setup and Hold times are measured over worst case conditions (process, voltage, temperature). Setup time is measured relative to the Global Clock input signal using the slowest process, highest temperature, and lowest voltage. Hold time is measured relative to the Global Clock input signal using the fastest process, lowest temperature, and highest voltage.
2. Default delay uses IODELAY2 tap 0.
3. IFF = Input Flip-Flop or Latch.

1. Setup and Hold times are measured over worst case conditions (process, voltage, temperature). Setup time is measured relative to the Global Clock input signal using the slowest process, highest temperature, and lowest voltage. Hold time is measured relative to the Global Clock input signal using the fastest process, lowest temperature, and highest voltage. These measurements include CMT jitter; DCM CLK0 driving PLL, PLL CLKOUT0 driving BUFG.
2. IFF = Input Flip-Flop or Latch
3. Use IBIS to determine any duty-cycle distortion incurred using various standards.

**Notes:**

1. LXT devices are not available with a -1L speed grade. The LX4 is not available in -3N speed grade.
2. These parameters represent the worst-case duty cycle distortion observable at the pins of the device using LVDS output buffers. For cases where other I/O standards are used, IBIS can be used to calculate any additional duty cycle distortion that might be caused by asymmetrical rise/fall times.
3. The  $T_{CKSKEW}$  value represents the worst-case clock-tree skew observable between sequential I/O elements. Significantly less clock-tree skew exists for I/O registers that are close to each other and fed by the same or adjacent clock-tree branches. Use the Xilinx FPGA Editor and Timing Analyzer tools to evaluate clock skew specific to your application.
4. The  $T_{CKSKEW}$  is 0.43 ns for the XA6SLX100 device using a -2 speed grade and 0.22 ns for the XC6SLX100 devices using the -2 speed grade.
