Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Notes:

- All voltages are relative to ground.
- See *Interface Performances for Memory Interfaces* in Table 25. The extended performance range is specified for designs not using the standard V_{CCINT} voltage range. The standard V_{CCINT} voltage range is used for:
 - Designs that do not use an MCB
 - LX4 devices
 - Devices in the TQG144 or CPG196 packages
 - Devices with the -3N speed grade
- Recommended maximum voltage droop for V_{CCAUX} is 10 mV/ms.
- During configuration, if V_{CCO_2} is 1.8V, then V_{CCAUX} must be 2.5V.
- The -1L devices require $V_{CCAUX} = 2.5V$ when using the LVDS_25, LVDS_33, BLVDS_25, LVPECL_25, RSDS_25, RSDS_33, PPDS_25, and PPDS_33 I/O standards on inputs. LVPECL_33 is not supported in the -1L devices.
- Configuration data is retained even if V_{CCO} drops to 0V.
- Includes V_{CCO} of 1.2V, 1.5V, 1.8V, 2.5V, and 3.3V.
- For PCI systems, the transmitter and receiver should have common supplies for V_{CCO} .
- Devices with a -1L speed grade do not support Xilinx PCI IP.
- Do not exceed a total of 100 mA per bank.
- V_{BATT} is required to maintain the battery backed RAM (BBR) AES key when V_{CCAUX} is not applied. Once V_{CCAUX} is applied, V_{BATT} can be unconnected. When BBR is not used, Xilinx recommends connecting to V_{CCAUX} or GND. However, V_{BATT} can be unconnected.

V_{CCINT}	Internal supply voltage relative to GND	1.14	1.2	1.26	V
t_j	Temperature range	15	–	85	$^{\circ}\text{C}$

Notes:

1. These specifications apply during programming of the eFUSE AES key. Programming is only supported through JTAG. The AES key is only supported in the following devices: LX75, LX75T, LX100, LX100T, LX150, and LX150T.
2. When programming eFUSE, V_{FS} must be less than or equal to V_{CCAUX} . When not programming or when eFUSE is not used, Xilinx recommends connecting V_{FS} to GND. However, V_{FS} can be between GND and 3.45 V.
3. An R_{FUSE} resistor is required when programming the eFUSE AES key. When not programming or when eFUSE is not used, Xilinx recommends connecting the R_{FUSE} pin to V_{CCAUX} or GND. However, R_{FUSE} can be unconnected.

Quiescent Current

Typical values for quiescent supply current are specified at nominal voltage, 25°C junction temperatures (T_j). Quiescent supply current is specified by speed grade for Spartan-6 devices. Xilinx recommends analyzing static power consumption using the XPOWER™ Estimator (XPE) tool (download at <http://www.xilinx.com/power>) for conditions other than those specified in Table 5.

IOB Pad Input/Output/3-State Switching Characteristics

[Table 28](#) (for commercial (XC) Spartan-6 devices) and [Table 29](#) (for Automotive XA Spartan-6 and Defense-grade Spartan-6Q devices) summarizes the values of standard-specific data input delays, output delays terminating at pads (based on standard), and 3-state delays.

- T_{IOPI} is described as the delay from IOB pad through the input buffer to the I-pin of an IOB pad. The delay varies depending on the capability of the SelectIO input buffer.
- T_{IOOP} is described as the delay from the O pin to the IOB pad through the output buffer of an IOB pad. The delay varies depending on the capability of the SelectIO output buffer.
- T_{IOTP} is described as the delay from the T pin to the IOB pad through the output buffer of an IOB pad, when 3-state is disabled. The delay varies depending on the SelectIO capability of the output buffer.

See the TRACE report for further information on delays when using an I/O standard with UNTUNED termination on inputs or outputs.

Notes:

1. The Spartan-6Q FPGA -1L values are listed in Table 28.

Table 30 summarizes the value of T_{IOTPHZ}. T_{IOTPHZ} is described as the delay from the T pin to the IOB pad through the output buffer of an IOB pad, when 3-state is enabled (i.e., a high impedance state). These delays are measured using LVC MOS25, Fast, 12 mA.

Table 30: IOB 3-state ON Output Switching Characteristics (T_{IOTPHZ})

Output Delay Measurements

Output delays are measured using a Tektronix P6245 TDS500/600 probe (< 1 pF) across approximately 4" of FR4 microstrip trace. Standard termination was used for all testing. The propagation delay of the 4" trace is characterized separately and subtracted from the final measurement, and is therefore not included in the generalized test setups shown in Figure 4 and Figure 5.

Figure 4: Single-Ended Test Setup

ds162_07_011309

Figure 5: Differential Test Setup

Measurements and test conditions are reflected in the IBIS models except where the IBIS format precludes it. Parameters V_{REF} , R_{REF} , C_{REF} , and V_{MEAS} fully describe the test conditions for each I/O standard. The most accurate prediction of propagation delay in any given application can be obtained through IBIS simulation, using the following method:

1. Simulate the output driver of choice into the generalized test setup, using values from Table 32.
2. Record the time to V_{MEAS} .
3. Simulate the output driver of choice into the actual PCB trace and load, using the appropriate IBIS model or capacitance value to represent the load.
4. Record the time to V_{MEAS} .
5. Compare the results of steps 2 and 4. The increase or decrease in delay yields the actual propagation delay of the PCB trace.

Notes:

1. Setup and Hold times are measured over worst case conditions (process, voltage, temperature). Setup time is measured relative to the Global Clock input signal using the slowest process, highest temperature, and lowest voltage. Hold time is measured relative to the Global Clock input signal using the fastest process, lowest temperature, and highest voltage. These measurements include PLL CLKOUT0 jitter.
2. IFF = Input Flip-Flop or Latch
3. Use IBIS to determine any duty-cycle distortion incurred using various standards.

Notes:

1. Setup and Hold times are measured over worst case conditions (process, voltage, temperature). Setup time is measured relative to the Global Clock input signal using the slowest process, highest temperature, and lowest voltage. Hold time is measured relative to the Global Clock input signal using the fastest process, lowest temperature, and highest voltage. These measurements include CMT jitter; DCM CLK0 driving PLL, PLL CLKOUT0 driving BUFG.
2. IFF = Input Flip-Flop or Latch
3. Use IBIS to determine any duty-cycle distortion incurred using various standards.

Date	Version	Description of Revisions
09/14/11	2.4	Production release of the XA6SLX4 and XA6SLX9 devices in Table 26 and Table 27 using ISE v13.2 software with -2 and -3 speed specification v1.19. Added production released version of the XA6SLX100 to Table 26 and Table 27 using ISE v13.3 software with -2 speed specification v1.20. Updated R_{OUT_TERM} description in Table 4. Fixed the LVPECL V_H error in Table 31. Updated introduction in Simultaneously Switching Outputs. Added the XA6SLX100 to Table 63 through Table 78, and Table 81. Added Note 4 to Table 78 because the T_{CKSKEW} for the XC6SLX100 is not the same as the T_{CKSKEW} for the XA6SLX100. Revised the revision history for version 1.6 dated 06/24/10. Removed the parenthetical statement about the -3N speed grade: (specifications are identical to the -3 speed grade).
10/17/11	3.0	Changed the data sheet from Preliminary Product Specification to Product Specification. Updated the Switching Characteristics, page 19 speed specification version ISE v13.3 software to -2 and -3 speed specification v1.20 and -1L speed specification of v1.08. Also updated Note 1 in Table 27. In Table 43, <i>Block RAM Switching Characteristics</i>, the F_{MAX} value for the -2 speed grade has been changed from 260 MHz to 280 MHz. In Table 54, <i>Switching Characteristics for the DLL</i>, a Note 6 was added and linked to CLKIN_CLKFB_PHASE.
