### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

2. When programming eFUSE,  $V_{FS}$  must be less than or equal to  $V_{CCAUX}$ . When not programming or when eFUSE is not used, Xilinx recommends connecting  $V_{FS}$  to GND. However,  $V_{FS}$  can be between GND and 3.45 V.
3. An  $R_{FUSE}$  resistor is required when programming the eFUSE AES key. When not programming or when eFUSE is not used, Xilinx recommends connecting the  $R_{FUSE}$  pin to  $V_{CCAUX}$  or GND. However,  $R_{FUSE}$  can be unconnected.

## Production Silicon and ISE Software Status

In some cases, a particular family member (and speed grade) is released to production before a speed specification is released with the correct label (Advance, Preliminary, Production). Any labeling discrepancies are corrected in subsequent speed specification releases. [Table 27](#) lists the production released Spartan-6 family member, speed grade, and the minimum corresponding supported speed specification version and ISE® software revisions. The ISE software and speed specifications listed are the minimum releases required for production. All subsequent releases of software and speed specifications are valid.

**Notes:**

1. Maximum frequency and setup/hold timing parameters are for 3.3V and 2.5V configuration voltages.
2. To support longer delays in configuration, use the design solutions described in [UG380: Spartan-6 FPGA Configuration User Guide](#).
3. [Table 6](#) specifies the power supply ramp time.
4. BPI mode is not supported in:
  - LX4, LX25, or LX25T devices
  - LX9 devices in the TQG144 package
  - LX9 or LX16 devices in the CPG196 package.
5. Only during configuration, the last edge is determined by a weak pull-up/pull-down resistor in the I/O.
6. Defense-grade Spartan-6Q -2Q devices configure in single default SPI Master (x1) mode at  $T_j = -55^{\circ}\text{C}$ . During operation and when using all other configuration functions, the minimum operating temperature is  $-40^{\circ}\text{C}$ .

CLKFB_DELAY_VAR_EXT	Allowable variation of the off-chip feedback delay from the DCM output to the CLKFB input.	–	±1	–	±1	–	±1	–	±1	ns	

### Notes:

1. DLL specifications apply when using any of the DLL outputs: CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, or CLKDV.
2. When operating independently of the DLL, the DFS supports lower CLKIN\_FREQ\_DLL frequencies. See Table 55.
3. The CLKIN\_DIVIDE\_BY\_2 attribute increases the effective input frequency range. When set to TRUE, the input clock frequency is divided by two as it enters the DCM. Input clock frequencies for the clock buffer being used can be increased up to the F<sub>MAX</sub> (see Table 48 and Table 49 for BUFG and BUFIO2 limits). When used with CLK\_FEEDBACK=2X, the input clock frequency matches the frequency for CLK2X, and is limited to CLKOUT\_FREQ\_2X.
4. CLKIN\_FREQ\_DLL input jitter beyond these limits can cause the DCM to lose LOCK, indicated by the LOCKED output deasserting. The user must then reset the DCM.
5. When using both DCMs in a CMT, both DCMs must be LOCKED.

- The values in this table are based on the operating conditions described in Table 53 and Table 58.
- The maximum variable phase shift range, MAX\_STEPS, is only valid when the DCM has no initial fixed-phase shifting, that is, the PHASE\_SHIFT attribute is set to 0.
- The DCM\_DELAY\_STEP values are provided at the end of Table 54.

**Notes:**

1. Setup and Hold times are measured over worst case conditions (process, voltage, temperature). Setup time is measured relative to the Global Clock input signal using the slowest process, highest temperature, and lowest voltage. Hold time is measured relative to the Global Clock input signal using the fastest process, lowest temperature, and highest voltage.
2. IFF = Input Flip-Flop or Latch.

## Source-Synchronous Switching Characteristics

The parameters in this section provide the necessary values for calculating timing budgets for Spartan-6 FPGA source-synchronous transmitter and receiver data-valid windows.
