Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Notes:

1. Stresses beyond those listed under Absolute Maximum Ratings might cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under Operating Conditions is not implied. Exposure to Absolute Maximum Ratings conditions for extended periods of time might affect device reliability.
2. When programming eFUSE, $V_{FS} \leq V_{CCAUX}$. Requires up to 40 mA current. For read mode, V_{FS} can be between GND and 3.45 V.
3. I/O absolute maximum limit applied to DC and AC signals. Overshoot duration is the percentage of a data period that the I/O is stressed beyond 3.45V.
4. For I/O operation, refer to UG381: *Spartan-6 FPGA SelectIO Resources User Guide*.
5. Maximum percent overshoot duration to meet 4.40V maximum.
6. For soldering guidelines and thermal considerations, see UG385: *Spartan-6 FPGA Packaging and Pinout Specification*.

		LX150	12.0	12.0	12.0	12.0	mA
		LX150T	12.0	12.0	12.0	N/A	mA

Notes:

1. Typical values are specified at nominal voltage, 25°C junction temperatures (Tj). Industrial (I) grade devices have the same typical values as commercial (C) grade devices at 25°C, but higher values at 100°C. Use the XPE tool to calculate 100°C values. Nominal V_{CCINT} is 1.20V; use the XPE tool to calculate 1.23V values for the nominal V_{CCINT} of the extended performance range.
2. Typical values are for blank configured devices with no output current loads, no active input pull-up resistors, all I/O pins are 3-state and floating.
3. If differential signaling is used, more accurate quiescent current estimates can be obtained by using the XPOWER Estimator (XPE) or XPOWER Analyzer (XPA) tools.

Table 6: **Power Supply Ramp Time**

Symbol	Description	Speed Grade	Ramp Time	Units
V_{CCINTR}	Internal supply voltage ramp time	-3, -3N, -2	0.20 to 50.0	ms
		-1L	0.20 to 40.0	ms
V_{CCO2}(1)	Output drivers bank 2 supply voltage ramp time	All	0.20 to 50.0	ms
V_{CCAUXR}	Auxiliary supply voltage ramp time	All	0.20 to 50.0	ms

Notes:

1. The minimum V_{CCO2} for power-on reset and configuration is 1.65V.
2. Spartan-6 FPGAs require a certain amount of supply current during power-on to insure proper device initialization. The actual current consumed depends on the power-on ramp rate of the power supply. Use the XPOWER Estimator (XPE) or XPOWER Analyzer (XPA) tools to estimate current drain on these supplies. Spartan-6 devices do not have a required power-on sequence.

In Table 9 and Table 10, values for V_{IL} and V_{IH} are recommended input voltages. Values for I_{OL} and I_{OH} are guaranteed over the recommended operating conditions at the V_{OL} and V_{OH} test points. Only selected standards are tested. These are chosen to ensure that all standards meet their specifications. The selected standards are tested at a minimum V_{CCO} with the respective V_{OL} and V_{OH} voltage levels shown. Other standards are sample tested.

MGTAVTTRCAL	Analog supply voltage for the resistor calibration circuit of the GTP transceiver bank (top or bottom)	1.14	1.20	1.26	V

Notes:

1. Each voltage listed requires the filter circuit described in UG386: *Spartan-6 FPGA GTP Transceivers User Guide*.
2. Voltages are specified for the temperature range of T_j = –40°C to +125°C.
3. The voltage level of MGTAVCCPLL must not exceed the voltage level of MGTAVCC +10mV. The voltage level of MGTAVCC must not exceed the voltage level of MGTAVCCPLL.

Switching Characteristics

All values represented in this data sheet are based on these speed specifications: v1.20 for -3, -3N, and -2; and v1.08 for -1L. Switching characteristics are specified on a per-speed-grade basis and can be designated as Advance, Preliminary, or Production. Each designation is defined as follows:

Advance

These specifications are based on simulations only and are typically available soon after device design specifications are frozen. Although speed grades with this designation are considered relatively stable and conservative, some under-reporting might still occur.

Preliminary

These specifications are based on complete ES (engineering sample) silicon characterization. Devices and speed grades with this designation are intended to give a better indication of the expected performance of production silicon. The probability of under-reporting delays is greatly reduced as compared to Advance data.

Production

These specifications are released once enough production silicon of a particular device family member has been characterized to provide full correlation between specifications and devices over numerous production lots. There is no under-reporting of delays, and customers receive formal notification of any subsequent changes. Typically, the slowest speed grades transition to Production before faster speed grades.

All specifications are always representative of worst-case supply voltage and junction temperature conditions.

Since individual family members are produced at different times, the migration from one category to another depends completely on the status of the fabrication process for each device.

The -1L speed grade refers to the lower-power Spartan-6 devices. The -3N speed grade refers to the Spartan-6 devices that do not support MCB functionality.

Table 26 correlates the current status of each Spartan-6 device on a per speed grade basis.

Testing of Switching Characteristics

All devices are 100% functionally tested. Internal timing parameters are derived from measuring internal test patterns. Listed below are representative values.

For more specific, more precise, and worst-case guaranteed data, use the values reported by the static timing analyzer and back-annotate to the simulation net list. Unless otherwise noted, values apply to all Spartan-6 devices.

Production Silicon and ISE Software Status

In some cases, a particular family member (and speed grade) is released to production before a speed specification is released with the correct label (Advance, Preliminary, Production). Any labeling discrepancies are corrected in subsequent speed specification releases. Table 27 lists the production released Spartan-6 family member, speed grade, and the minimum corresponding supported speed specification version and ISE® software revisions. The ISE software and speed specifications listed are the minimum releases required for production. All subsequent releases of software and speed specifications are valid.

Notes:

1. Input waveform switches between V_L and V_H.
2. Measurements are made at typical, minimum, and maximum V_{REF} values. Reported delays reflect worst case of these measurements. V_{REF} values listed are typical.
3. Input voltage level from which measurement starts.
4. This is an input voltage reference that bears no relation to the V_{REF} / V_{MEAS} parameters found in IBIS models and/or noted in Figure 4.
5. The value given is the differential input voltage.

LOCK_DLL(3)	When using the DLL alone: The time from deassertion at the DCM's reset input to the rising transition at its LOCKED output. When the DCM is locked, the CLKIN and CLKFB signals are in phase. CLKIN_FREQ_DLL < 50 MHz.	–	5	–	5	–	5	–	5	ms
	When using the DLL alone: The time from deassertion at the DCM's reset input to the rising transition at its LOCKED output. When the DCM is locked, the CLKIN and CLKFB signals are in phase. CLKIN_FREQ_DLL > 50 MHz	–	0.60	–	0.60	–	0.60	–	0.60	ms
Delay Lines										
DCM_DELAY_STEP(5)	Finest delay resolution, averaged over all steps.	10	40	10	40	10	40	10	40	ps

Notes:

1. The values in this table are based on the operating conditions described in Table 2 and Table 53.
2. Indicates the maximum amount of output jitter that the DCM adds to the jitter on the CLKIN input.
3. For optimal jitter tolerance and faster LOCK time, use the CLKIN_PERIOD attribute.
4. Some jitter and duty-cycle specifications include 1% of input clock period or 0.01 UI. For example, this data sheet specifies a maximum jitter of ±(1% of CLKIN period + 150 ps). Assuming that the CLKIN frequency is 100 MHz, the equivalent CLKIN period is 10 ns. Since 1% of 10 ns is 0.1 ns or 100 ps, the maximum jitter is ±(100 ps + 150 ps) = ±250 ps.
5. A typical delay step size is 23 ps.
6. The timing analysis tools use the CLK_FEEDBACK = 1X condition for the CLKIN_CLKFB_PHASE value (reported as phase error). When using CLK_FEEDBACK = 2X, add 100 ps to the phase error for the CLKIN_CLKFB_PHASE value (as shown in this table).

Input Clock Jitter Tolerance(4)										
CLKIN_CYC_JITT_FX_LF	Cycle-to-cycle jitter at the CLKIN input, based on CLKFX output frequency: FCLKFX < 150 MHz.	–	±300	–	±300	–	±300	–	±300	ps
CLKIN_CYC_JITT_FX_HF	Cycle-to-cycle jitter at the CLKIN input, based on CLKFX output frequency: FCLKFX > 150 MHz.	–	±150	–	±150	–	±150	–	±150	ps
CLKIN_PER_JITT_FX	Period jitter at the CLKIN input.	–	±1	–	±1	–	±1	–	±1	ns

Notes:

1. DFS specifications apply when using either of the DFS outputs (CLKFX or CLKFX180).
2. When using both DFS and DLL outputs on the same DCM, follow the more restrictive CLKIN_FREQ_DLL specifications in Table 53.
3. The CLKIN_DIVIDE_BY_2 attribute increases the effective input frequency range. When set to TRUE, the input clock frequency is divided by two as it enters the DCM. Input clock frequencies for the clock buffer being used can be increased up to the F_{MAX} (see Table 48 and Table 49 for BUFG and BUFIO2 limits).
4. CLKIN input jitter beyond these limits can cause the DCM to lose LOCK.

Table 56: **Switching Characteristics for the Digital Frequency Synthesizer (DFS) for DCM_SP[1]**

Output Clock Jitter[2][3]										
CLKOUT_PER_JITT_FX	Period jitter at the CLKFX and CLKFX180 outputs. When CLKIN < 20 MHz	Use the Clocking Wizard								ps
	Period jitter at the CLKFX and CLKFX180 outputs. When CLKIN > 20 MHz	Typical = ±(1% of CLKFX period + 100)								ps
Duty Cycle[4][5]										
CLKOUT_DUTY_CYCLE_FX	Duty cycle precision for the CLKFX and CLKFX180 outputs including the BUFGMUX and clock tree duty-cycle distortion	Maximum = ±(1% of CLKFX period + 350)								ps
Phase Alignment[5]										
CLKOUT_PHASE_FX	Phase offset between the DFS CLKFX output and the DLL CLK0 output when both the DFS and DLL are used	–	±200	–	±200	–	±200	–	±250	ps
CLKOUT_PHASE_FX180	Phase offset between the DFS CLKFX180 output and the DLL CLK0 output when both the DFS and DLL are used	Maximum = ±(1% of CLKFX period + 200)								ps
LOCKED Time										
LOCK_FX[2]	When FCLKIN < 50 MHz, the time from deassertion at the DCM's reset input to the rising transition at its LOCKED output. The DFS asserts LOCKED when the CLKFX and CLKFX180 signals are valid. When using both the DLL and the DFS, use the longer locking time.	–	5	–	5	–	5	–	5	ms
	When FCLKIN > 50 MHz, the time from deassertion at the DCM's reset input to the rising transition at its LOCKED output. The DFS asserts LOCKED when the CLKFX and CLKFX180 signals are valid. When using both the DLL and the DFS, use the longer locking time.	–	0.45	–	0.45	–	0.45	–	0.60	ms

Notes:

1. The values in this table are based on the operating conditions described in Table 2 and Table 55.
2. For optimal jitter tolerance and a faster LOCK time, use the CLKIN_PERIOD attribute.
3. Output jitter is characterized with no input jitter. Output jitter strongly depends on the environment, including the number of SSOs, the output drive strength, CLB utilization, CLB switching activities, switching frequency, power supply, and PCB design. The actual maximum output jitter depends on the system application.
4. The CLKFX, CLKFXDV, and CLKFX180 outputs have a duty cycle of approximately 50%.
5. Some duty cycle and alignment specifications include a percentage of the CLKFX output period. For example, this data sheet specifies a maximum CLKFX jitter of ±(1% of CLKFX period + 200 ps). Assuming that the CLKFX output frequency is 100 MHz, the equivalent CLKFX period is 10 ns, and 1% of 10 ns is 0.1 ns or 100 ps. Accordingly, the maximum jitter is ±(100 ps + 200 ps) = ±300 ps.

Notes:

1. LXT devices are not available with a -1L speed grade.
2. This parameter indicates the total sampling error of Spartan-6 FPGA DDR input registers, measured across voltage, temperature, and process. The characterization methodology uses the DCM to capture the DDR input registers' edges of operation. These measurements include:
   - CLK0 DCM jitter
   - DCM accuracy (phase offset)
   - DCM phase shift resolution

   These measurements do not include package or clock tree skew.
3. This parameter indicates the total sampling error of Spartan-6 FPGA DDR input registers, measured across voltage, temperature, and process. The characterization methodology uses the BUFIO2 clock network and IODELAY2 to capture the DDR input registers' edges of operation. These measurements do not include package or clock tree skew.
