Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Notes:

- All voltages are relative to ground.
- See *Interface Performances for Memory Interfaces* in Table 25. The extended performance range is specified for designs not using the standard V_{CCINT} voltage range. The standard V_{CCINT} voltage range is used for:
 - Designs that do not use an MCB
 - LX4 devices
 - Devices in the TQG144 or CPG196 packages
 - Devices with the -3N speed grade
- Recommended maximum voltage droop for V_{CCAUX} is 10 mV/ms.
- During configuration, if V_{CCO_2} is 1.8V, then V_{CCAUX} must be 2.5V.
- The -1L devices require $V_{CCAUX} = 2.5V$ when using the LVDS_25, LVDS_33, BLVDS_25, LVPECL_25, RSDS_25, RSDS_33, PPDS_25, and PPDS_33 I/O standards on inputs. LVPECL_33 is not supported in the -1L devices.
- Configuration data is retained even if V_{CCO} drops to 0V.
- Includes V_{CCO} of 1.2V, 1.5V, 1.8V, 2.5V, and 3.3V.
- For PCI systems, the transmitter and receiver should have common supplies for V_{CCO} .
- Devices with a -1L speed grade do not support Xilinx PCI IP.
- Do not exceed a total of 100 mA per bank.
- V_{BATT} is required to maintain the battery backed RAM (BBR) AES key when V_{CCAUX} is not applied. Once V_{CCAUX} is applied, V_{BATT} can be unconnected. When BBR is not used, Xilinx recommends connecting to V_{CCAUX} or GND. However, V_{BATT} can be unconnected.

Production Silicon and ISE Software Status

In some cases, a particular family member (and speed grade) is released to production before a speed specification is released with the correct label (Advance, Preliminary, Production). Any labeling discrepancies are corrected in subsequent speed specification releases. [Table 27](#) lists the production released Spartan-6 family member, speed grade, and the minimum corresponding supported speed specification version and ISE® software revisions. The ISE software and speed specifications listed are the minimum releases required for production. All subsequent releases of software and speed specifications are valid.

IOB Pad Input/Output/3-State Switching Characteristics

[Table 28](#) (for commercial (XC) Spartan-6 devices) and [Table 29](#) (for Automotive XA Spartan-6 and Defense-grade Spartan-6Q devices) summarizes the values of standard-specific data input delays, output delays terminating at pads (based on standard), and 3-state delays.

- T_{IOPI} is described as the delay from IOB pad through the input buffer to the I-pin of an IOB pad. The delay varies depending on the capability of the SelectIO input buffer.
- T_{IOOP} is described as the delay from the O pin to the IOB pad through the output buffer of an IOB pad. The delay varies depending on the capability of the SelectIO output buffer.
- T_{IOTP} is described as the delay from the T pin to the IOB pad through the output buffer of an IOB pad, when 3-state is disabled. The delay varies depending on the SelectIO capability of the output buffer.

See the TRACE report for further information on delays when using an I/O standard with UNTUNED termination on inputs or outputs.

Notes:

- The values in this table are based on the operating conditions described in Table 2 and Table 55.
- For optimal jitter tolerance and a faster LOCK time, use the CLKIN_PERIOD attribute.
- Output jitter is characterized with no input jitter. Output jitter strongly depends on the environment, including the number of SSOs, the output drive strength, CLB utilization, CLB switching activities, switching frequency, power supply, and PCB design. The actual maximum output jitter depends on the system application.
- The CLKFX, CLKFXDV, and CLKFX180 outputs have a duty cycle of approximately 50%.
- Some duty cycle and alignment specifications include a percentage of the CLKFX output period. For example, this data sheet specifies a maximum CLKFX jitter of $\pm(1\%$ of CLKFX period + 200 ps). Assuming that the CLKFX output frequency is 100 MHz, the equivalent CLKFX period is 10 ns, and 1% of 10 ns is 0.1 ns or 100 ps. Accordingly, the maximum jitter is $\pm(100\text{ ps} + 200\text{ ps}) = \pm 300\text{ ps}$.

Symbol	Description	Amount of Phase Shift	Units

When using CLKIN_DIVIDE_BY_2 = TRUE, double the clock-effective clock period.	$\pm(\text{INTEGER}(10 \times (\text{TCLKIN} - 3 \text{ ns})))$	steps
	When CLKIN ≥ 60 MHz, the maximum allowed number of DCM_DELAY_STEP steps for a given CLKIN clock period, where T = CLKIN clock period in ns. When using CLKIN_DIVIDE_BY_2 = TRUE, double the clock-effective clock period.	$\pm(\text{INTEGER}(15 \times (\text{TCLKIN} - 3 \text{ ns})))$	steps

FINE_SHIFT_RANGE_MAX	Maximum guaranteed delay for variable phase shifting	$\pm(\text{MAX_STEPS} \times \text{DCM_DELAY_STEP_MAX})$	ps

Notes:

- The values in this table are based on the operating conditions described in Table 53 and Table 58.
- The maximum variable phase shift range, MAX_STEPS, is only valid when the DCM has no initial fixed-phase shifting, that is, the PHASE_SHIFT attribute is set to 0.
- The DCM_DELAY_STEP values are provided at the end of Table 54.

Setup time is measured relative to the Global Clock input signal using the slowest process, highest temperature, and lowest voltage. Hold time is measured relative to the Global Clock input signal using the fastest process, lowest temperature, and highest voltage.
- IFF = Input Flip-Flop or Latch.
