### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

#### Details

Product Status	Active
Core Processor	ARM® Cortex®-M0+
Core Size	32-Bit Single-Core
Speed	40MHz
Connectivity	I <sup>2</sup> C, LINbus, SPI, UART/USART
Peripherals	LVD, POR, PWM, WDT
Number of I/O	57
Program Memory Size	32KB (32K x 8)
Program Memory Type	FLASH
EEPROM Size	256 x 8
RAM Size	4K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 5.5V
Data Converters	A/D 16x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	64-LQFP
Supplier Device Package	64-LQFP (10x10)

## 2.4 Example

This is an example part number:

S9KEAZN64AMLH

## 3 Ratings

### 3.1 Thermal handling ratings

Symbol	Description	Min.	Max.	Unit	Notes
T <sub>STG</sub>	Storage temperature	-55	150	°C	1
T <sub>SDR</sub>	Solder temperature, lead-free	—	260	°C	2

1. Determined according to JEDEC Standard JESD22-A103, *High Temperature Storage Life*.
2. Determined according to IPC/JEDEC Standard J-STD-020, *Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices*.

### 3.2 Moisture handling ratings

Symbol	Description	Min.	Max.	Unit	Notes
MSL	Moisture sensitivity level	—	3	—	1

1. Determined according to IPC/JEDEC Standard J-STD-020, *Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices*.

### 3.3 ESD handling ratings

Symbol	Description	Min.	Max.	Unit	Notes
$V_{\text{HBM}}$	Electrostatic discharge voltage, human body model	−6000	+6000	V	1
$V_{\text{CDM}}$	Electrostatic discharge voltage, charged-device model	−500	+500	V	2
$I_{\text{LAT}}$	Latch-up current at ambient temperature of °C	−100	+100	mA	3

1. Determined according to JEDEC Standard JESD22-A114, *Electrostatic Discharge (ESD) Sensitivity Testing Human Body Model (HBM)*.
2. Determined according to JEDEC Standard JESD22-C101, *Field-Induced Charged-Device Model Test Method for Electrostatic-Discharge-Withstand Thresholds of Microelectronic Components*.
3. Determined according to JEDEC Standard JESD78D, *IC Latch-up Test*. The test produced the following results:
  - Test was performed at 125 °C case temperature (Class II).
  - I/O pins pass +100/-100 mA I-test with  $I_{\text{DD}}$  current limit at 800 mA ( $V_{\text{DD}}$  collapsed during positive injection).
  - I/O pins pass +70/-100 mA I-test with  $I_{\text{DD}}$  current limit at 1000 mA for  $V_{\text{DD}}$ .
  - Supply groups pass 1.5  $V_{\text{CCmax}}$ .
  - RESET\_B pin was only tested with negative I-test due to product conditioning requirement.

### 3.4 Voltage and current operating ratings

Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the limits specified in the following table may affect device reliability or cause permanent damage to the device. For functional operating conditions, refer to the remaining tables in this document.

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for instance, either  $V_{\text{SS}}$  or  $V_{\text{DD}}$ ) or the programmable pullup resistor associated with the pin is enabled.

**Table 1. Voltage and current operating ratings**

Symbol	Description	Min.	Max.	Unit
$V_{\text{DD}}$	Digital supply voltage	−0.3	6.0	V
$I_{\text{DD}}$	Maximum current into $V_{\text{DD}}$	—	120	mA
$V_{\text{IN}}$	Input voltage except true open drain pins	−0.3	$V_{\text{DD}} + 0.3$ <sup>1</sup>	V
	Input voltage of true open drain pins	−0.3	6	V
$I_{\text{D}}$	Instantaneous maximum current single pin limit (applies to all port pins)	−25	25	mA
$V_{\text{DDA}}$	Analog supply voltage	$V_{\text{DD}} - 0.3$	$V_{\text{DD}} + 0.3$	V

1. Maximum rating of  $V_{\text{DD}}$  also applies to  $V_{\text{IN}}$ .

**Table 2. DC characteristics (continued)**

Symbol	Descriptions			Min	Typical <sup>1</sup>	Max	Unit
$I_{INTOT}$	Total leakage combined for all port pins	Pins in high impedance input mode	$V_{IN} = V_{DD}$ or $V_{SS}$	—	—	2	$\mu A$
$R_{PU}$	Pullup resistors	All digital inputs, when enabled (all I/O pins other than PTA2 and PTA3)	—	30.0	—	50.0	k $\Omega$
$R_{PU}^3$	Pullup resistors	PTA2 and PTA3 pins	—	30.0	—	60.0	k $\Omega$
$I_{IC}$	DC injection current <sup>4, 5, 6</sup>	Single pin limit	$V_{IN} < V_{SS}$ , $V_{IN} > V_{DD}$	-2	—	2	mA
		Total MCU limit, includes sum of all stressed pins		-5	—	25	
$C_{In}$	Input capacitance, all pins		—	—	—	7	pF
$V_{RAM}$	RAM retention voltage		—	2.0	—	—	V

- Typical values are measured at 25 °C. Characterized, not tested.
- Only PTB4, PTB5, PTD0, PTD1, PTE0, PTE1, PTH0, and PTH1 support high current output.
- The specified resistor value is the actual value internal to the device. The pullup value may appear higher when measured externally on the pin.
- All functional non-supply pins, except for PTA2 and PTA3, are internally clamped to  $V_{SS}$  and  $V_{DD}$ . PTA2 and PTA3 are true open drain I/O pins that are internally clamped to  $V_{SS}$ .
- Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger value.
- Power supply must maintain regulation within operating  $V_{DD}$  range during instantaneous and operating maximum current conditions. If the positive injection current ( $V_{IN} > V_{DD}$ ) is higher than  $I_{DD}$ , the injection current may flow out of  $V_{DD}$  and could result in external power supply going out of regulation. Ensure that external  $V_{DD}$  load will shunt current higher than maximum injection current when the MCU is not consuming power, such as when no system clock is present, or clock rate is very low (which would reduce overall power consumption).

1. Data in Typical column was characterized at 5.0 V, 25 °C or is typical recommended value.
2. RTC adder causes I<sub>DD</sub> to increase typically by less than 1 μA; RTC clock source is 1 kHz LPO clock.
3. LVD is periodically woken up from Stop by 5% duty cycle. The period is equal to or less than 2 ms.

## Switching specifications

1. Typical values are based on characterization data at  $V_{DD} = 5.0\text{ V}$ ,  $25\text{ }^{\circ}\text{C}$  unless otherwise stated.
2. This is the shortest pulse that is guaranteed to be recognized as a RESET pin request.
3. This is the minimum pulse width that is guaranteed to pass through the pin synchronization circuitry. Shorter pulses may or may not be recognized. In stop mode, the synchronizer is bypassed so shorter pulses can be recognized.
4. Timing is shown with respect to 20%  $V_{DD}$  and 80%  $V_{DD}$  levels. Temperature range  $-40\text{ }^{\circ}\text{C}$  to  $125\text{ }^{\circ}\text{C}$ .

Figure 9. Reset timing

Figure 10. KBIPx timing

## 4.2.2 FTM module timing

Synchronizer circuits determine the shortest input pulses that can be recognized or the fastest clock that can be used as the optional external source to the timer counter. These synchronizers operate from the current bus rate clock.

Table 6. FTM input timing

Function	Symbol	Min	Max	Unit
External clock frequency	$f_{TCLK}$	0	$f_{Bus}/4$	Hz
External clock period	$t_{TCLK}$	4	—	$t_{cyc}$
External clock high time	$t_{clkh}$	1.5	—	$t_{cyc}$

## Peripheral operating requirements and behaviors

4. Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
5. Thermal resistance between the die and the solder pad on the bottom of the package. Interface resistance is ignored.
6. Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization.

The average chip-junction temperature ( $T_J$ ) in  $^{\circ}\text{C}$  can be obtained from:

$$T_J = T_A + (P_D \times \theta_{JA})$$

Where:

$T_A$  = Ambient temperature,  $^{\circ}\text{C}$

$\theta_{JA}$  = Package thermal resistance, junction-to-ambient,  $^{\circ}\text{C}/\text{W}$

$$P_D = P_{\text{int}} + P_{\text{I/O}}$$

$P_{\text{int}} = I_{\text{DD}} \times V_{\text{DD}}$ , Watts - chip internal power

$P_{\text{I/O}}$  = Power dissipation on input and output pins - user determined

For most applications,  $P_{\text{I/O}} \ll P_{\text{int}}$  and can be neglected. An approximate relationship between  $P_D$  and  $T_J$  (if  $P_{\text{I/O}}$  is neglected) is:

$$P_D = K \div (T_J + 273 \text{ }^{\circ}\text{C})$$

Solving the equations above for  $K$  gives:

$$K = P_D \times (T_A + 273 \text{ }^{\circ}\text{C}) + \theta_{JA} \times (P_D)^2$$

where  $K$  is a constant pertaining to the particular part.  $K$  can be determined by measuring  $P_D$  (at equilibrium) for a known  $T_A$ . Using this value of  $K$ , the values of  $P_D$  and  $T_J$  can be obtained by solving the above equations iteratively for any value of  $T_A$ .

**Table 9. OSC and ICS specifications (temperature range = -40 to 125 °C ambient) (continued)**

Num	Characteristic		Symbol	Min	Typical <sup>1</sup>	Max	Unit
13	Frequency accuracy of DCO output using factory trim value	Over temperature range from -40 °C to 125°C	$\Delta f_{\text{dco\_ft}}$	-2.3	—	0.8	%
14	FLL acquisition time <sup>4,6</sup>		$t_{\text{Acquire}}$	—	—	2	ms
15	Long term jitter of DCO output clock (averaged over 2 ms interval) <sup>7</sup>		$C_{\text{Jitter}}$	—	0.02	0.2	% $f_{\text{dco}}$

1. Data in Typical column was characterized at 5.0 V, 25 °C or is typical recommended value.
2. See crystal or resonator manufacturer's recommendation.
3. Load capacitors ( $C_1, C_2$ ), feedback resistor ( $R_F$ ) and series resistor ( $R_S$ ) are incorporated internally when RANGE = HGO = 0.
4. This parameter is characterized and not tested on each device.
5. Proper PC board layout procedures must be followed to achieve specifications.
6. This specification applies to any time the FLL reference source or reference divider is changed, trim value changed, or changing from FLL disabled (FBELP, FBILP) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.
7. Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum  $f_{\text{Bus}}$ . Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the FLL circuitry via  $V_{\text{DD}}$  and  $V_{\text{SS}}$  and variation in crystal oscillator frequency increase the  $C_{\text{Jitter}}$  percentage for a given interval.

## 5.5 Communication interfaces

### 5.5.1 SPI switching specifications

The serial peripheral interface (SPI) provides a synchronous serial bus with master and slave operations. Many of the transfer attributes are programmable. The following tables provide timing characteristics for classic SPI timing modes. See the SPI chapter of the chip's reference manual for information about the modified transfer formats used for communicating with slower peripheral devices. All timing is shown with respect to 20%  $V_{DD}$  and 80%  $V_{DD}$ , unless noted, and 25 pF load on all SPI pins. All timing assumes slew rate control is disabled and high-drive strength is enabled for SPI output pins.

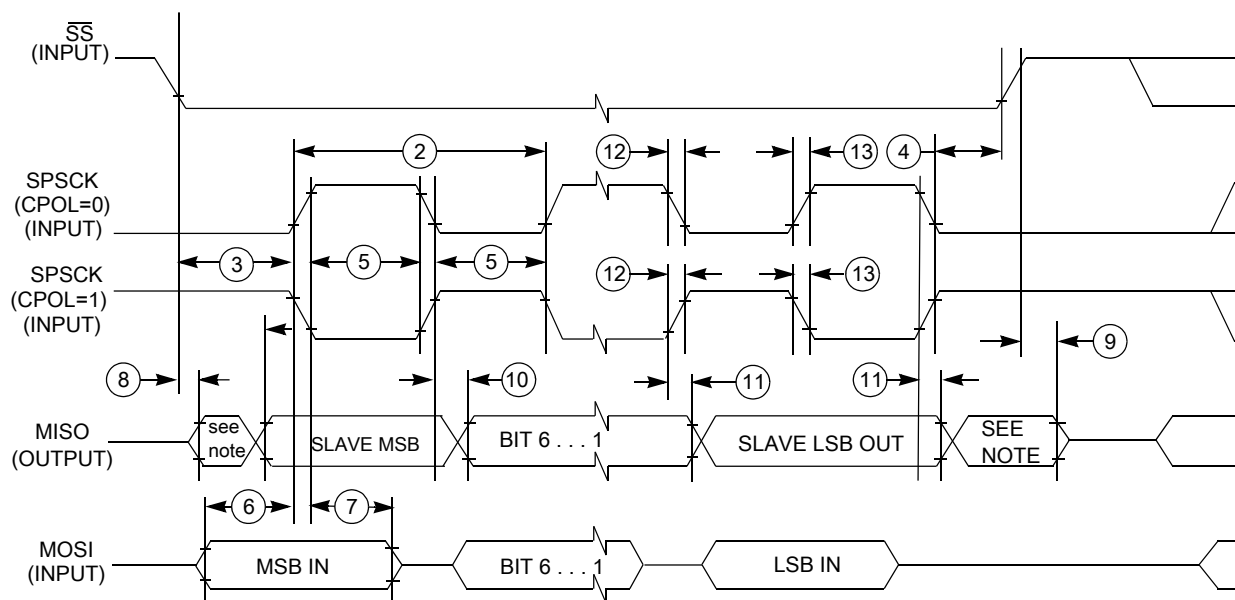

**Table 14. SPI master mode timing**

Nu m.	Symbol	Description	Min.	Max.	Unit	Comment
1	$f_{op}$	Frequency of operation	$f_{Bus}/2048$	$f_{Bus}/2$	Hz	$f_{Bus}$ is the bus clock
2	$t_{SPSCK}$	SPSCK period	$2 \times t_{Bus}$	$2048 \times t_{Bus}$	ns	$t_{Bus} = 1/f_{Bus}$
3	$t_{Lead}$	Enable lead time	1/2	—	$t_{SPSCK}$	—
4	$t_{Lag}$	Enable lag time	1/2	—	$t_{SPSCK}$	—

## 6 Dimensions

### 6.1 Obtaining package dimensions

Package dimensions are provided in package drawings.

To find a package drawing, go to [nxp.com](http://nxp.com) and perform a keyword search for the drawing's document number:

If you want the drawing for this package	Then use this document number
