Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

5 Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).

2.3 Power Considerations

The average chip-junction temperature, T_J, in °C can be obtained from the following:

$$T_J = T_A + (P_D \times \theta_{JA}) \quad (1)$$

where

T_A = ambient temperature °C

θ_{JA} = package thermal resistance, junction to ambient, °C/W

$P_D = P_{INT} + P_{I/O}$

$P_{INT} = I_{DD} \times V_{DD}$ Watts (chip internal power)

$P_{I/O}$ = power dissipation on input and output pins (determined by user)

For most applications $P_{I/O} < 0.3 \times P_{INT}$. If $P_{I/O}$ is neglected, an approximate relationship between P_D and T_J is the following:

$$P_D = K/(T_J + 273° C) \quad (2)$$

Solving equations (1) and (2) for K gives:

$$K = P_D \times (T_A + 273° C) + \theta_{JA} \times P_D^2 \quad (3)$$

2.4 AC Electrical Characteristics

The following sections include illustrations and tables of clock diagrams, signals, and CPM outputs and inputs for the 66 MHz MPC826xA device. Note that AC timings are based on a 50-p*f* load. Typical output buffer impedances are shown in Table 6.

NOTE

Activating data pipelining (setting BR*x*[DR] in the memory controller) improves the AC timing. When data pipelining is activated, sp12 can be used for data bus setup even when ECC or PARITY are used. Also, sp33a can be used as the AC specification for DP signals.

Figure 9 shows the interaction of several bus signals.

3 Clock Configuration Modes

To configure the main PLL multiplication factor and the core, CPM, and 60x bus frequencies, the MODCK[1–3] pins are sampled while $\overline{\text{HRESET}}$ is asserted. Table 13 lists the eight basic configuration modes. Table 14 lists the other modes that are available by using the configuration pin ($\overline{\text{RSTCONF}}$) and driving four bits from hardware configuration word on the data bus.

Note that the MPC8265 and the MPC8266 have two additional clocking modes—PCI agent and PCI host. Refer to Section 3.2, “PCI Mode” on page 26 for information.

NOTE

Clock configurations change only after $\overline{\text{POR}}$ is asserted.

3.1 Local Bus Mode

Table 13 describes default clock modes for the MPC826xA.

1 Input clock frequency is given only for the purpose of reference. User should set MODCK_H–MODCK_L so that the resulting configuration does not exceed the frequency rating of the user's part.

2 The frequency depends on the value of PCI_MODCK. If PCI_MODCK is high (logic '1'), the PCI frequency is divided by 2 (33 instead of 66 MHz, etc.). Refer to Table 15.

3 In this mode, PCI_MODCK must be "0".

3 On PCI devices (MPC8265 and MPC8266) this pin should be used as CLKIN2. On non-PCI devices (MPC8260A and MPC8264) this is a spare pin that must be pulled down or left floating.
4 Must be pulled down or left floating.
5 On PCI devices (MPC8265 and MPC8266) this pin should be asserted if the PCI function is desired or pulled up or left floating if PCI is not desired. On non-PCI devices (MPC8260A and MPC8264) this is a spare pin that must be pulled up or left floating.
6 For information on how to use this pin, refer to *MPC8260 PowerQUICC II Thermal Resistor Guide* available at www.freescale.com.

5 Package Description

The following sections provide the package parameters and mechanical dimensions for the MPC826xA.

5.1 Package Parameters

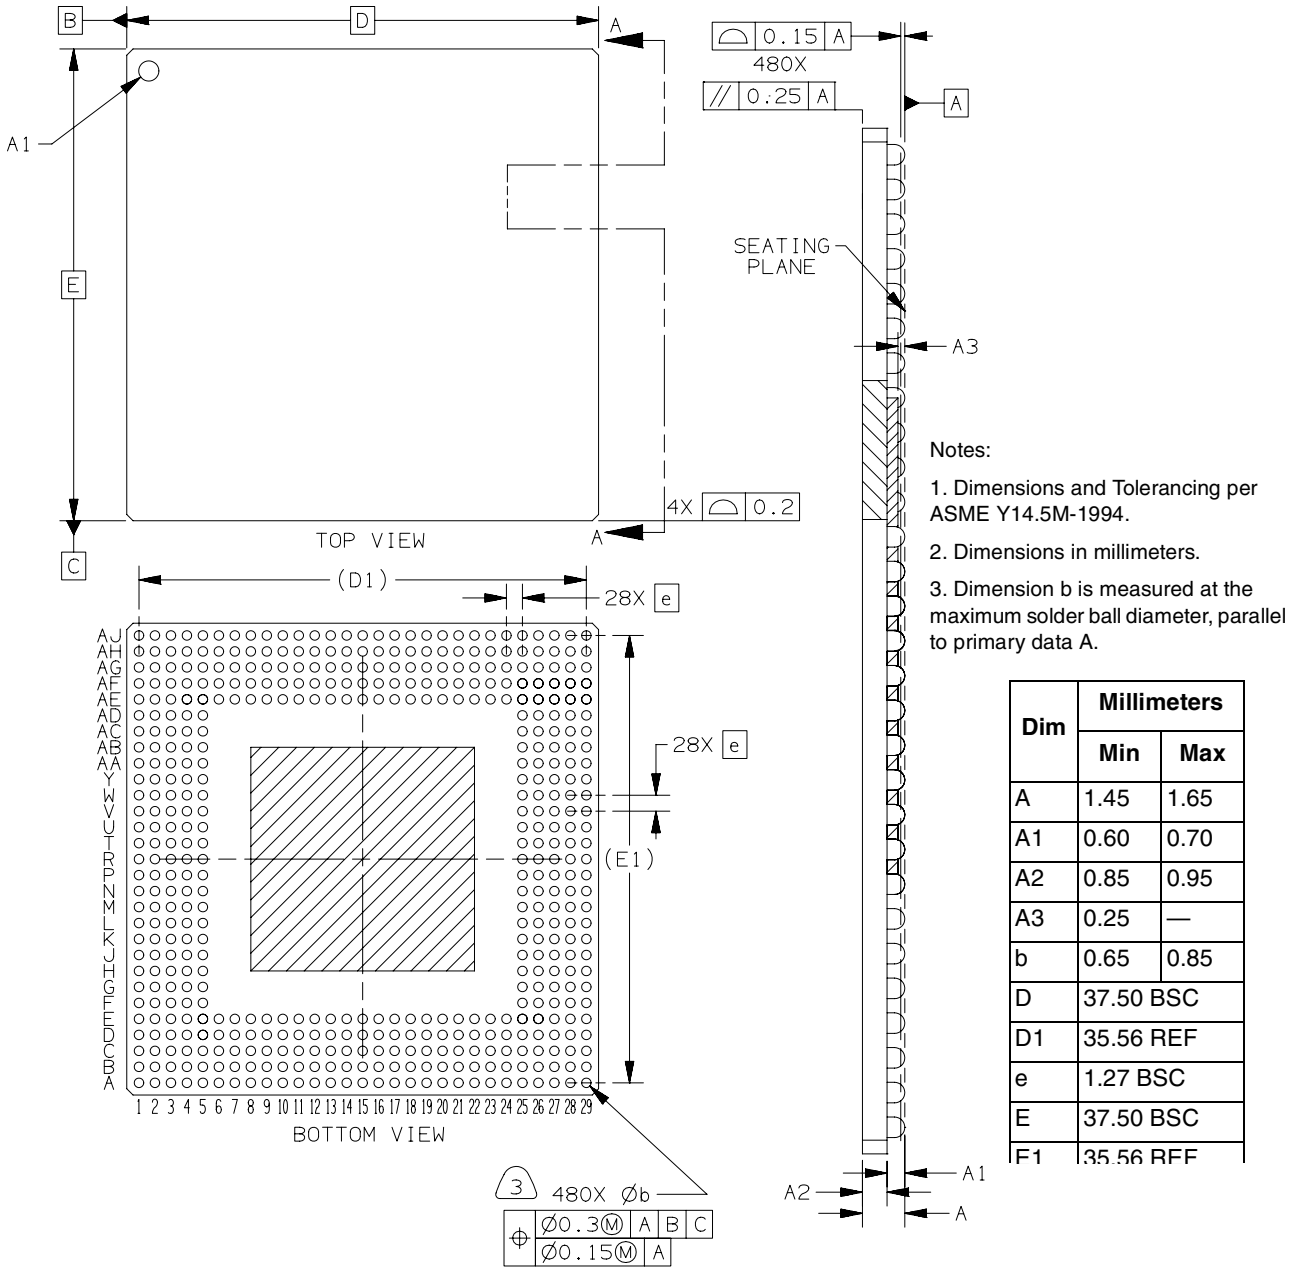
Package parameters are provided in Table 22. The package type is a 37.5 × 37.5 mm, 480-lead TBGA.

Table 22. Package Parameters

Parameter	Value
Package Outline	37.5 × 37.5 mm
Interconnects	480 (29 × 29 ball array)
Pitch	1.27 mm
Nominal unmounted package height	1.55 mm

5.2 Mechanical Dimensions

Figure 15 provides the mechanical dimensions and bottom surface nomenclature of the 480 TBGA package.



Notes:

1. Dimensions and Tolerancing per ASME Y14.5M-1994.
2. Dimensions in millimeters.
3. Dimension b is measured at the maximum solder ball diameter, parallel to primary data A.
