Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Table 2 lists recommended operational voltage conditions.

Table 2. Recommended Operating Conditions[1]

Rating	Symbol	Value			Unit
Core supply voltage	VDD	1.7 – 1.9[2]	1.7–2.1[3]	1.9 –2.2[4]	V
PLL supply voltage	VCCSYN	1.7 – 1.9[2]	1.7–2.1[3]	1.9–2.2[4]	V
I/O supply voltage	VDDH	3.135 – 3.465			V
Input voltage	VIN	GND (–0.3) – 3.465			V
Junction temperature (maximum)	T_j	105[5]			°C
Ambient temperature	T_A	0–70[5]			°C

1 **Caution:** These are the recommended and tested operating conditions. Proper device operating outside of these conditions is not guaranteed.
2 CPU frequency less than or equal to 200 MHz.
3 CPU frequency greater than 200 MHz but less than 233 MHz.
4 CPU frequency greater than or equal to 233 MHz.
5 Note that for extended temperature parts the range is $(-40)_{T_A} – 105_{T_j}$.

NOTE: Core, PLL, and I/O Supply Voltages

VDDH, VCCSYN, and VDD must track each other and both must vary in the same direction—in the positive direction (+5% and +0.1 Vdc) or in the negative direction (–5% and –0.1 Vdc).

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (either GND or V_{CC}).

Figure 2 shows the undershoot and overshoot voltage of the 60x and local bus memory interface of the MPC8280. Note that in PCI mode the I/O interface is different.

1 Input specifications are measured from the 50% level of the signal to the 50% level of the rising edge of CLKIN. Timings are measured at the pin.

Note that although the specifications generally reference the rising edge of the clock, the following AC timing diagrams also apply when the falling edge is the active edge.

Note: There are four possible timing conditions for SCC and SPI:
1. Input sampled on the rising edge and output driven on the rising edge (shown).
2. Input sampled on the rising edge and output driven on the falling edge.
3. Input sampled on the falling edge and output driven on the falling edge.

Figure 11 shows signal behavior in MEMC mode.

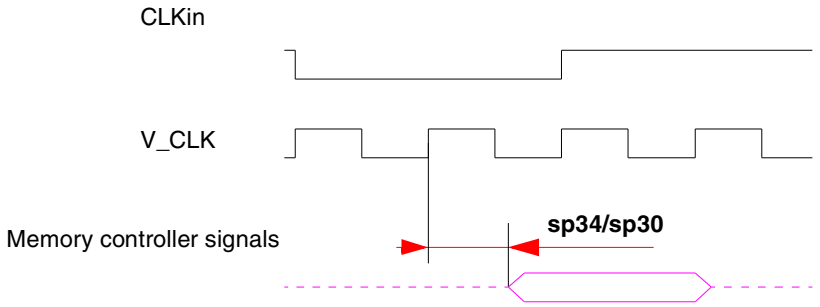

Figure 11. MEMC Mode Diagram

NOTE

Generally, all MPC826xA bus and system output signals are driven from the rising edge of the input clock (CLKin). Memory controller signals, however, trigger on four points within a CLKin cycle. Each cycle is divided by four internal ticks: T1, T2, T3, and T4. T1 always occurs at the rising edge, and T3 at the falling edge, of CLKin. However, the spacing of T2 and T4 depends on the PLL clock ratio selected, as shown in Table 11.

Table 11. Tick Spacing for Memory Controller Signals

PLL Clock Ratio	Tick Spacing (T1 Occurs at the Rising Edge of CLKin)		
	T2	T3	T4
1:2, 1:3, 1:4, 1:5, 1:6	1/4 CLKin	1/2 CLKin	3/4 CLKin
1:2.5	3/10 CLKin	1/2 CLKin	8/10 CLKin
1:3.5	4/14 CLKin	1/2 CLKin	11/14 CLKin

Figure 12 is a graphical representation of Table 11.

3 Clock Configuration Modes

To configure the main PLL multiplication factor and the core, CPM, and 60x bus frequencies, the MODCK[1–3] pins are sampled while $\overline{\text{HRESET}}$ is asserted. Table 13 lists the eight basic configuration modes. Table 14 lists the other modes that are available by using the configuration pin ($\overline{\text{RSTCONF}}$) and driving four bits from hardware configuration word on the data bus.

Note that the MPC8265 and the MPC8266 have two additional clocking modes—PCI agent and PCI host. Refer to Section 3.2, “PCI Mode” on page 26 for information.

NOTE

Clock configurations change only after $\overline{\text{POR}}$ is asserted.

3.1 Local Bus Mode

Table 13 describes default clock modes for the MPC826xA.

Table 13. Clock Default Modes

MODCK[1–3]	Input Clock Frequency	CPM Multiplication Factor	CPM Frequency	Core Multiplication Factor	Core Frequency
000	33 MHz	3	100 MHz	4	133 MHz
001	33 MHz	3	100 MHz	5	166 MHz
010	33 MHz	4	133 MHz	4	133 MHz
011	33 MHz	4	133 MHz	5	166 MHz
100	66 MHz	2	133 MHz	2.5	166 MHz
101	66 MHz	2	133 MHz	3	200 MHz
110	66 MHz	2.5	166 MHz	2.5	166 MHz
111	66 MHz	2.5	166 MHz	3	200 MHz

Table 14 describes all possible clock configurations when using the hard reset configuration sequence. Note that basic modes are shown in boldface type. The frequencies listed are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user’s device.

0001_001	33 MHz	2	66 MHz	5	166 MHz
0001_010	33 MHz	2	66 MHz	6	200 MHz
0001_011	33 MHz	2	66 MHz	7	233 MHz
0001_100	33 MHz	2	66 MHz	8	266 MHz

Table 14. Clock Configuration Modes[1] (continued)

MODCK_H–MODCK[1–3]	Input Clock Frequency[2,3]	CPM Multiplication Factor[2]	CPM Frequency[2]	Core Multiplication Factor[2]	Core Frequency[2]
1000_001	66 MHz	3.5	233 MHz	3	200 MHz
1000_010	66 MHz	3.5	233 MHz	3.5	233 MHz
1000_011	66 MHz	3.5	233 MHz	4	266 MHz
1000_100	66 MHz	3.5	233 MHz	4.5	300 MHz

1 Because of speed dependencies, not all of the possible configurations in Table 14 are applicable.
2 The user should choose the input clock frequency and the multiplication factors such that the frequency of the CPU is equal to or greater than 150 MHz and the CPM ranges between 66–233 MHz.
3 Input clock frequency is given only for the purpose of reference. The user should set MODCK_H–MODCK_L so that the resulting configuration does not exceed the frequency rating of the user's part.

3.2 PCI Mode

The MPC8265 and the MPC8266 have three clocking modes: local, PCI host, and PCI agent. The clocking mode is set according to three input pins—PCI_MODE, PCI_CFG[0], PCI_MODCK—as shown in Table 15.

Table 15. MPC8265 and MPC8266 Clocking Modes

Pins			Clocking Mode	PCI Clock Frequency Range (MHZ)
PCI_MODE	PCI_CFG[0]	PCI_MODCK		
1	—	—	Local bus	—
0	0	0	PCI host	50–66
0	0	1		25–50
0	1	0	PCI agent	50–66
0	1	1		25–50

In addition, note the following:

NOTE: PCI_MODCK

In PCI mode only, PCI_MODCK comes from the LGPL5 pin and MODCK_H[0–3] comes from {LGPL0, LGPL1, LGPL2, LGPL3}.

NOTE: Tval (Output Hold)

The minimum Tval = 2 when PCI_MODCK = 1, and the minimum Tval = 1 when PCI_MODCK = 0. Therefore, designers should use clock configurations that fit this condition to achieve PCI-compliant AC timing.

NOTE

Clock configurations change only after $\overline{\text{POR}}$ is asserted.

3 On PCI devices (MPC8265 and MPC8266) this pin should be used as CLKIN2. On non-PCI devices (MPC8260A and MPC8264) this is a spare pin that must be pulled down or left floating.
4 Must be pulled down or left floating.
5 On PCI devices (MPC8265 and MPC8266) this pin should be asserted if the PCI function is desired or pulled up or left floating if PCI is not desired. On non-PCI devices (MPC8260A and MPC8264) this is a spare pin that must be pulled up or left floating.
6 For information on how to use this pin, refer to *MPC8260 PowerQUICC II Thermal Resistor Guide* available at www.freescale.com.

5 Package Description

The following sections provide the package parameters and mechanical dimensions for the MPC826xA.

5.1 Package Parameters

Package parameters are provided in Table 22. The package type is a 37.5 × 37.5 mm, 480-lead TBGA.

Table 22. Package Parameters

Parameter	Value
