

Welcome to [E-XFL.COM](http://E-XFL.COM)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

| Details                    |                                                                                                                                                                               |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Product Status             | Active                                                                                                                                                                        |
| Core Processor             | MIPS32® M4K™                                                                                                                                                                  |
| Core Size                  | 32-Bit Single-Core                                                                                                                                                            |
| Speed                      | 72MHz                                                                                                                                                                         |

## 6.0 RESETS

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/44-pin XLP Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 7. “Resets”** (DS60001118), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

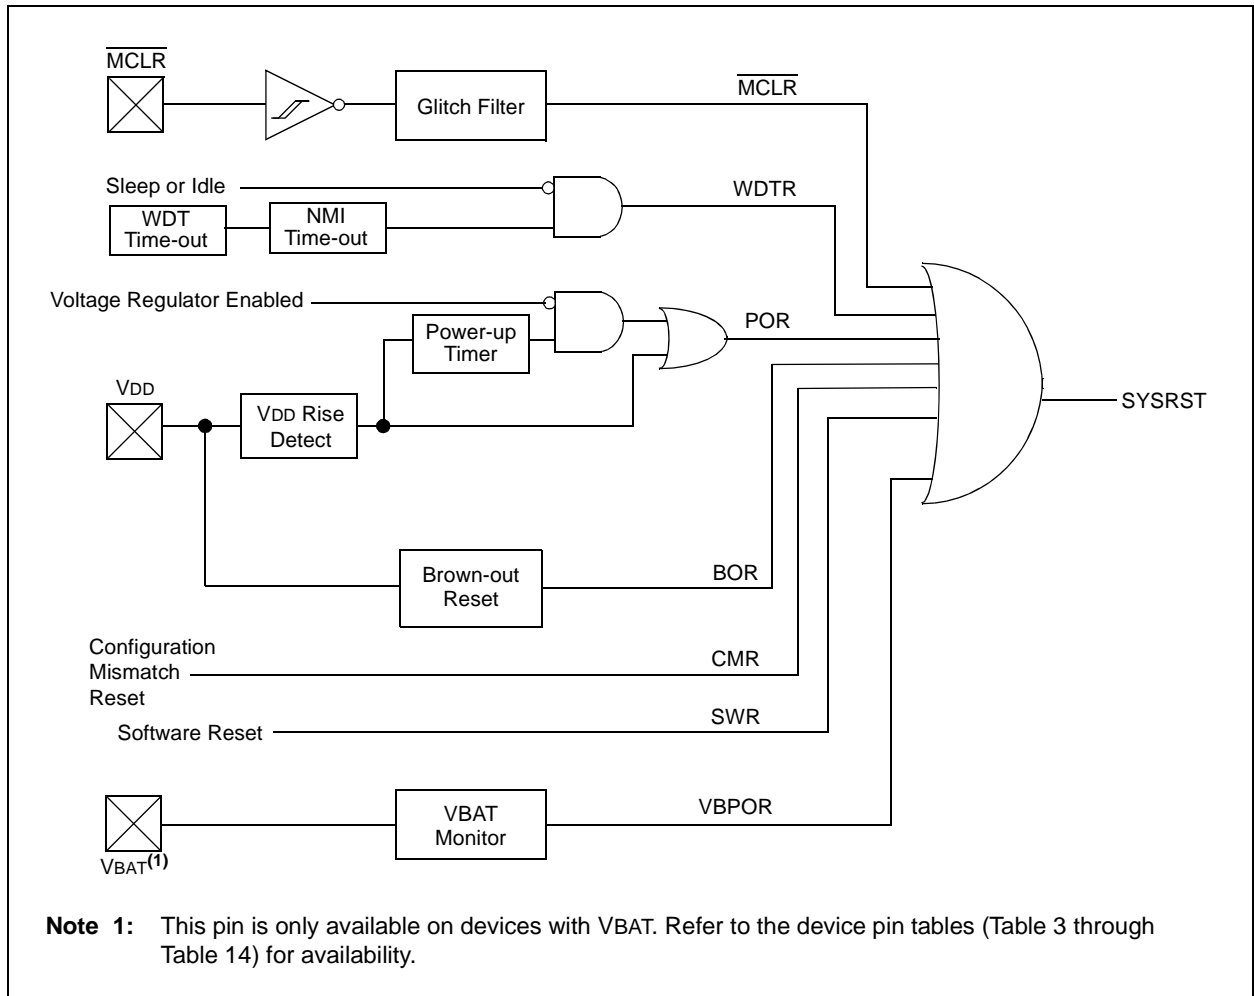

The Reset module combines all Reset sources and controls the device Master Reset signal, SYSRST. The device Reset sources are as follows:

- Power-on Reset (POR)
- Brown-out Reset (BOR)
- VBAT Power-on Reset (VBPOR)
- Master Clear Reset pin ( $\overline{\text{MCLR}}$ )
- Software Reset (SWR)
- Watchdog Timer Reset (WDTR)
- Configuration Mismatch Reset (CMR)

All device Reset will set a corresponding Status bit in the RCON register (see Register 6-1) to indicate the type of reset.

A simplified block diagram of the Reset module is illustrated in Figure 6-1.

**FIGURE 6-1: SYSTEM RESET BLOCK DIAGRAM**

## REGISTER 9-4: DCRCCON: DMA CRC CONTROL REGISTER (CONTINUED)

- bit 6     **CRCAPP:** CRC Append Mode bit<sup>(1)</sup>  
1 = The DMA transfers data from the source into the CRC but NOT to the destination. When a block transfer completes the DMA writes the calculated CRC value to the location given by CHxDSA  
0 = The DMA transfers data from the source through the CRC obeying WBO as it writes the data to the destination
- bit 5     **CRCTYP:** CRC Type Selection bit  
1 = The CRC module will calculate an IP header checksum  
0 = The CRC module will calculate a LFSR CRC
- bit 4-3   **Unimplemented:** Read as '0'
- bit 2-0   **CRCCH<2:0>:** CRC Channel Select bits  
111 = Reserved  
110 = Reserved  
101 = Reserved  
100 = Reserved  
011 = CRC is assigned to Channel 3  
010 = CRC is assigned to Channel 2  
001 = CRC is assigned to Channel 1  
000 = CRC is assigned to Channel 0

**Note 1:** When WBO = 1, unaligned transfers are not supported and the CRCAPP bit cannot be set.

**Legend:**

R = Readable bit                      W = Writable bit                      U = Unimplemented bit, read as '0'  
-n = Value at POR                      '1' = Bit is set                      '0' = Bit is cleared                      x = Bit is unknown

bit 31-8 **Unimplemented:** Read as '0'

bit 7 **ID:** ID Pin State Indicator bit

1 = No cable is attached or a "type B" cable has been inserted into the USB receptacle

0 = A "type A" OTG cable has been inserted into the USB receptacle

bit 6 **Unimplemented:** Read as '0'

bit 5 **LSTATE:** Line State Stable Indicator bit

1 = USB line state (SE0 (U1CON<6>) bit and JSTATE (U1CON<7>)) bit has been stable for previous 1 ms

0 = USB line state (SE0 and JSTATE) has not been stable for previous 1 ms

bit 4 **Unimplemented:** Read as '0'

bit 3 **SESVD:** Session Valid Indicator bit

1 = VBUS voltage is above Session Valid on the A or B device

0 = VBUS voltage is below Session Valid on the A or B device

bit 2 **SESEND:** B-Device Session End Indicator bit

1 = VBUS voltage is below Session Valid on the B device

0 = VBUS voltage is above Session Valid on the B device

bit 1 **Unimplemented:** Read as '0'

bit 0 **VBUSVD:** A-Device VBUS Valid Indicator bit

1 = VBUS voltage is above Session Valid on the A device

0 = VBUS voltage is below Session Valid on the A device

# PIC32MX1XX/2XX 28/44-PIN XLP FAMILY

## 17.0 INPUT CAPTURE

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/44-pin XLP Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 15. "Input Capture"** (DS60001122), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

The Input Capture module is useful in applications requiring frequency (period) and pulse measurement.

The Input Capture module captures the 16-bit or 32-bit value of the selected Time Base registers when an event occurs at the ICx pin. The following events cause capture events:

- Simple capture event modes:
  - Capture timer value on every rising and falling edge of input at ICx pin
  - Capture timer value on every edge (rising and falling)
  - Capture timer value on every edge (rising and falling), specified edge first.

- Prescaler capture event modes:
  - Capture timer value on every 4th rising edge of input at ICx pin
  - Capture timer value on every 16th rising edge of input at ICx pin

Each input capture channel can select between one of two 16-bit timers (Timer2 or Timer3) for the time base, or two 16-bit timers (Timer2 and Timer3) together to form a 32-bit timer. The selected timer can use either an internal or external clock.

Other operational features include:

- Device wake-up from capture pin during Sleep and Idle modes
- Interrupt on input capture event
- 4-word FIFO buffer for capture values (interrupt optionally generated after 1, 2, 3, or 4 buffer locations are filled)
- Input capture can also be used to provide additional sources of external interrupts

Figure 17-1 illustrates a general block diagram of the Input Capture module.

**FIGURE 17-1: INPUT CAPTURE BLOCK DIAGRAM**

# PIC32MX1XX/2XX 28/44-PIN XLP FAMILY

---

## REGISTER 17-1: ICxCON: INPUT CAPTURE 'x' CONTROL REGISTER (CONTINUED)

bit 2-0      **ICM<2:0>**: Input Capture Mode Select bits

- 111 = Interrupt-Only mode (only supported while in Sleep mode or Idle mode)
- 110 = Simple Capture Event mode – every edge, specified edge first and every edge thereafter
- 101 = Prescaled Capture Event mode – every sixteenth rising edge
- 100 = Prescaled Capture Event mode – every fourth rising edge
- 011 = Simple Capture Event mode – every rising edge
- 010 = Simple Capture Event mode – every falling edge
- 001 = Edge Detect mode – every edge (rising and falling)
- 000 = Input Capture module is disabled

**Note 1:** When using 1:1 PBCLK divisor, the user's software should not read/write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.

# PIC32MX1XX/2XX 28/44-PIN XLP FAMILY

---

## REGISTER 20-2: I2CxSTAT: I<sup>2</sup>C STATUS REGISTER (CONTINUED)

- bit 4     **P:** Stop bit  
1 = Indicates that a Stop bit has been detected last  
0 = Stop bit was not detected last  
Hardware set or clear when Start, Repeated Start or Stop detected.
- bit 3     **S:** Start bit  
1 = Indicates that a Start (or Repeated Start) bit has been detected last  
0 = Start bit was not detected last  
Hardware set or clear when Start, Repeated Start or Stop detected.
- bit 2     **R\_W:** Read/Write Information bit (when operating as I<sup>2</sup>C slave)  
1 = Read – indicates data transfer is output from slave  
0 = Write – indicates data transfer is input to slave  
Hardware set or clear after reception of I<sup>2</sup>C device address byte.
- bit 1     **RBF:** Receive Buffer Full Status bit  
1 = Receive complete, I2CxRCV is full  
0 = Receive not complete, I2CxRCV is empty  
Hardware set when I2CxRCV is written with received byte. Hardware clear when software reads I2CxRCV.
- bit 0     **TBF:** Transmit Buffer Full Status bit  
1 = Transmit in progress, I2CxTRN is full  
0 = Transmit complete, I2CxTRN is empty  
Hardware set when software writes I2CxTRN. Hardware clear at completion of data transmission.

| DC25                                           | 100                    | —    | $\mu\text{A}$                                                                                                                                                                                                                                   | +25°C, 3.3V LPRC (31 kHz) ( <b>Note 4</b> ) |

**Note 1:** A device's IDD supply current is mainly a function of the operating voltage and frequency. Other factors, such as PBCLK (Peripheral Bus Clock) frequency, number of peripheral modules enabled, internal code execution pattern, execution from Program Flash memory vs. SRAM, I/O pin loading and switching rate, oscillator type, as well as temperature, can have an impact on the current consumption.

**2:** The test conditions for IDD measurements are as follows:

- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL oscillator is disabled if the USB module is implemented, PBCLK divisor = 1:8
- CPU, Program Flash, and SRAM data memory are operational, SRAM data memory Wait states = 1
- No peripheral modules are operating, (ON bit = 0), but the associated PMD bit is cleared
- WDT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to Vss
- $\overline{\text{MCLR}} = V_{\text{DD}}$
- CPU executing `while(1)` statement from Flash
- RTCC and JTAG are disabled

**3:** Data in "Typical" column is at 3.3V, 25°C at specified operating frequency unless otherwise stated. Parameters are for design guidance only and are not tested.

**4:** This parameter is characterized, but not tested in manufacturing.

**5:** IPD electrical characteristics for devices with 256 KB Flash are only provided as Preliminary information.

| DI60a              | I <sub>ICL</sub>  | <b>Input Low Injection Current</b>                                     | 0                                                                                                                                                                     | —                   | -5 <sup>(2,5)</sup>   | mA    | This parameter applies to all pins, with the exception of the power pins.                                                                          |
| DI60b              | I <sub>ICH</sub>  | <b>Input High Injection Current</b>                                    | 0                                                                                                                                                                     | —                   | +5 <sup>(3,4,5)</sup> | mA    | This parameter applies to all pins, with the exception of all 5V tolerant pins, and the SOSC1, SOSCO, OSC1, D+, and D- pins.                       |
| DI60c              | ∑I <sub>ICT</sub> | <b>Total Input Injection Current (sum of all I/O and Control pins)</b> | -20 <sup>(6)</sup>                                                                                                                                                    | —                   | +20 <sup>(6)</sup>    | mA    | Absolute instantaneous sum of all ± input injection currents from all I/O pins (   I <sub>ICL</sub> +   I <sub>ICH</sub>   ) ≤ ∑I <sub>ICT</sub> ) |

- Note 1:** Data in “Typical” column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.
- 2:** V<sub>IL</sub> source < (V<sub>SS</sub> - 0.3). Characterized but not tested.
- 3:** V<sub>IH</sub> source > (V<sub>DD</sub> + 0.3) for non-5V tolerant pins only.
- 4:** Digital 5V tolerant pins do not have an internal high side diode to V<sub>DD</sub>, and therefore, cannot tolerate any “positive” input injection current.
- 5:** Injection currents > | 0 | can affect the ADC results by approximately 4 to 6 counts (i.e., V<sub>IH</sub> Source > (V<sub>DD</sub> + 0.3) or V<sub>IL</sub> source < (V<sub>SS</sub> - 0.3)).
- 6:** Any number and/or combination of I/O pins not excluded under I<sub>ICL</sub> or I<sub>ICH</sub> conditions are permitted provided the “absolute instantaneous” sum of the input injection currents from all pins do not exceed the specified limit. If **Note 2**, I<sub>ICL</sub> = ((V<sub>SS</sub> - 0.3) - V<sub>IL</sub> source) / R<sub>S</sub>). If **Note 3**, I<sub>ICH</sub> = ((I<sub>ICH</sub> source - (V<sub>DD</sub> + 0.3)) / R<sub>S</sub>). R<sub>S</sub> = Resistance between input source voltage and device pin. If (V<sub>SS</sub> - 0.3) ≤ V<sub>SOURCE</sub> ≤ (V<sub>DD</sub> + 0.3), injection current = 0.

# PIC32MX1XX/2XX 28/44-PIN XLP FAMILY

---

NOTES:

# PIC32MX1XX/2XX 28/44-PIN XLP FAMILY

28-Lead Plastic Small Outline (SO) - Wide, 7.50 mm Body [SOIC]

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

## RECOMMENDED LAND PATTERN

| Dimension Limits         | Units | MILLIMETERS |      |      |
|--------------------------|-------|-------------|------|------|
|                          |       | MIN         | NOM  | MAX  |
| Contact Pitch            | E     | 1.27 BSC    |      |      |
| Contact Pad Spacing      | C     |             | 9.40 |      |
| Contact Pad Width (X28)  | X     |             |      | 0.60 |
| Contact Pad Length (X28) | Y     |             |      | 2.00 |
| Distance Between Pads    | Gx    | 0.67        |      |      |
| Distance Between Pads    | G     | 7.40        |      |      |

**Notes:**

1. Dimensioning and tolerancing per ASME Y14.5M

BSC: Basic Dimension. Theoretically exact value shown without tolerances.

Microchip Technology Drawing No. C04-2052A
