### Understanding **Embedded - CPLDs (Complex Programmable Logic Devices)**

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

## Description

The CoolRunner™ XPLA3 XCR3256XL device is a 3.3V, 256 macrocell CPLD targeted at power sensitive designs that require leading edge programmable logic solutions. A total of 16 function blocks provide 6,000 usable gates. Pin-to-pin propagation delays are as fast as 7.0 ns with a maximum system frequency of 154 MHz.

## TotalCMOS Design Technique for Fast Zero Power

CoolRunner XPLA3 CPLDs offer a TotalCMOS™ solution, both in process technology and design technique. These CPLDs employ a cascade of CMOS gates to implement their sum of products, instead of the traditional sense amp approach. This CMOS gate implementation allows Xilinx CPLDs to offer devices that are both high performance and low power, breaking the paradigm that to have low power, you must have low performance. Refer to [Figure 1](#) and [Table 1](#) showing the  $I_{CC}$  vs. Frequency of our XCR3256XL TotalCMOS CPLD (data taken with 16 resettable up/down, 16-bit counters at 3.3V, 25°C).
