Welcome to E-XFL.COM

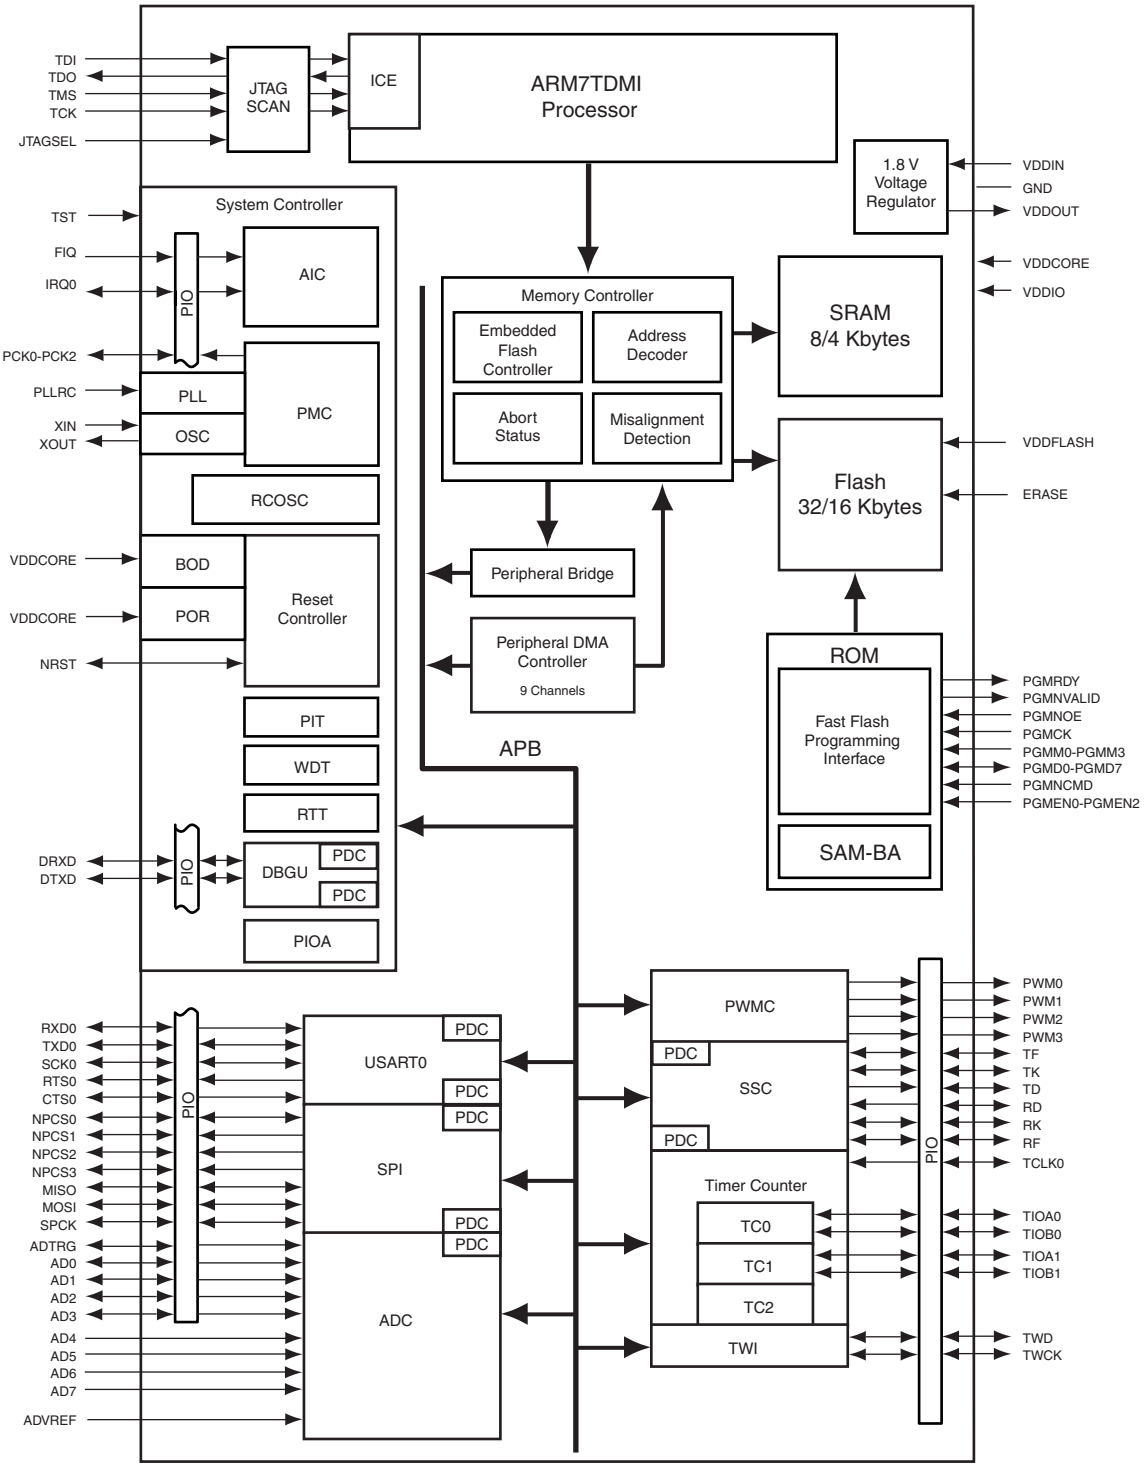
What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	ARM7®
Core Size	16/32-Bit
Speed	55MHz
Connectivity	I²C, SPI, SSC, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	32
Program Memory Size	64KB (64K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	16K x 8
Voltage - Supply (Vcc/Vdd)	1.65V ~ 1.95V
Data Converters	A/D 8x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	64-LQFP
Supplier Device Package	64-LQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/at91sam7s64-au-001

Figure 2-2. SAM7S32/16 Block Diagram



3. Signal Description

Table 3-1. Signal Description List

VDDIN	Voltage and ADC Regulator Power Supply Input	Power		3.0 to 3.6V
VDDOUT	Voltage Regulator Output	Power		1.85V nominal
VDDFLASH	Flash Power Supply	Power		3.0V to 3.6V
VDDIO	I/O Lines Power Supply	Power		3.0V to 3.6V or 1.65V to 1.95V
VDDCORE	Core Power Supply	Power		1.65V to 1.95V
VDDPLL	PLL	Power		1.65V to 1.95V
GND	Ground	Ground		
XIN	Main Oscillator Input	Input		
XOUT	Main Oscillator Output	Output		
PLLRC	PLL Filter	Input		
PCK0 - PCK2	Programmable Clock Output	Output		
TCK	Test Clock	Input		No pull-up resistor
TDI	Test Data In	Input		No pull-up resistor
TDO	Test Data Out	Output		
TMS	Test Mode Select	Input		No pull-up resistor
JTAGSEL	JTAG Selection	Input		Pull-down resistor(1)
ERASE	Flash and NVM Configuration Bits Erase Command	Input	High	Pull-down resistor(1)
NRST	Microcontroller Reset	I/O	Low	Open-drain with pull-Up resistor
TST	Test Mode Select	Input	High	Pull-down resistor(1)
DRXD	Debug Receive Data	Input		
DTXD	Debug Transmit Data	Output		
IRQ0 - IRQ1	External Interrupt Inputs	Input		IRQ1 not present on SAM7S32/16
FIQ	Fast Interrupt Input	Input		
PA0 - PA31	Parallel IO Controller A	I/O		Pulled-up input at reset PA0 - PA20 only on SAM7S32/16

4.3 48-lead LQFP and 48-pad QFN Package Outlines

Figure 4-3 and Figure 4-4 show the orientation of the 48-lead LQFP and the 48-pad QFN package. A detailed mechanical description is given in the section Mechanical Characteristics of the full datasheet.

Figure 4-3. 48-lead LQFP Package (Top View)

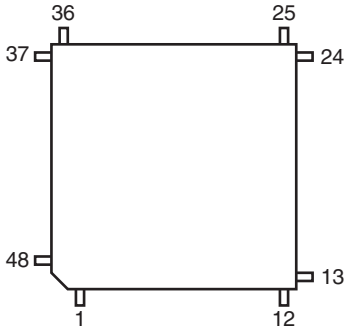


Figure 4-4. 48-pad QFN Package (Top View)

12	PA20/AD3	24	PA7/PGMNVALID	36	PA0/PGMEN0	48	VDDPLL

Note: 1. The bottom pad of the QFN package must be connected to ground.

- Fast access time, 30 MHz single-cycle access in Worst Case conditions
- Page programming time: 6 ms, including page auto-erase
- Page programming without auto-erase: 3 ms
- Full chip erase time: 15 ms
- 10,000 write cycles, 10-year data retention capability
- 16 lock bits, protecting 16 sectors of 32 pages
- Protection Mode to secure contents of the Flash

- 16 Kbytes of Fast SRAM
  - Single-cycle access at full speed

8.5 SAM7S321/32

- 32 Kbytes of Flash Memory, single plane
  - 256 pages of 128 bytes
  - Fast access time, 30 MHz single-cycle access in Worst Case conditions
  - Page programming time: 6 ms, including page auto-erase
  - Page programming without auto-erase: 3 ms
  - Full chip erase time: 15 ms
  - 10,000 write cycles, 10-year data retention capability
  - 8 lock bits, protecting 8 sectors of 32 pages
  - Protection Mode to secure contents of the Flash
- 8 Kbytes of Fast SRAM
  - Single-cycle access at full speed

8.6 SAM7S161/16

- 16 Kbytes of Flash Memory, single plane
  - 256 pages of 64 bytes
  - Fast access time, 30 MHz single-cycle access in Worst Case conditions
  - Page programming time: 6 ms, including page auto-erase
  - Page programming without auto-erase: 3 ms
  - Full chip erase time: 15 ms
  - 10,000 write cycles, 10-year data retention capability
  - 8 lock bits, protecting 8 sectors of 32 pages
  - Protection Mode to secure contents of the Flash
- 4 Kbytes of Fast SRAM
  - Single-cycle access at full speed

8.8.3 Lock Regions

8.8.3.1 SAM7S512

Two Embedded Flash Controllers each manage 16 lock bits to protect 16 regions of the flash against inadvertent flash erasing or programming commands. The SAM7S512 contains 32 lock regions and each lock region contains 64 pages of 256 bytes. Each lock region has a size of 16 Kbytes.

If a locked-region's erase or program command occurs, the command is aborted and the LOCKE bit in the MC_FSR register rises and the interrupt line rises if the LOCKE bit has been written at 1 in the MC_FMR register.

The 16 NVM bits (or 32 NVM bits) are software programmable through the corresponding EFC User Interface. The command "Set Lock Bit" enables the protection. The command "Clear Lock Bit" unlocks the lock region.

Asserting the ERASE pin clears the lock bits, thus unlocking the entire Flash.

8.8.3.2 SAM7S256

The Embedded Flash Controller manages 16 lock bits to protect 16 regions of the flash against inadvertent flash erasing or programming commands. The SAM7S256 contains 16 lock regions and each lock region contains 64 pages of 256 bytes. Each lock region has a size of 16 Kbytes.

If a locked-region's erase or program command occurs, the command is aborted and the LOCKE bit in the MC_FSR register rises and the interrupt line rises if the LOCKE bit has been written at 1 in the MC_FMR register.

The 16 NVM bits are software programmable through the EFC User Interface. The command "Set Lock Bit" enables the protection. The command "Clear Lock Bit" unlocks the lock region.

Asserting the ERASE pin clears the lock bits, thus unlocking the entire Flash.

8.8.3.3 SAM7S128

The Embedded Flash Controller manages 8 lock bits to protect 8 regions of the flash against inadvertent flash erasing or programming commands. The SAM7S128 contains 8 lock regions and each lock region contains 64 pages of 256 bytes. Each lock region has a size of 16 Kbytes.

If a locked-region's erase or program command occurs, the command is aborted and the LOCKE bit in the MC_FSR register rises and the interrupt line rises if the LOCKE bit has been written at 1 in the MC_FMR register.

The 8 NVM bits are software programmable through the EFC User Interface. The command "Set Lock Bit" enables the protection. The command "Clear Lock Bit" unlocks the lock region.

Asserting the ERASE pin clears the lock bits, thus unlocking the entire Flash.

8.8.3.4 SAM7S64

The Embedded Flash Controller manages 16 lock bits to protect 16 regions of the flash against inadvertent flash erasing or programming commands. The SAM7S64 contains 16 lock regions and each lock region contains 32 pages of 128 bytes. Each lock region has a size of 4 Kbytes.

If a locked-region's erase or program command occurs, the command is aborted and the LOCKE bit in the MC_FSR register rises and the interrupt line rises if the LOCKE bit has been written at 1 in the MC_FMR register.

The 16 NVM bits are software programmable through the EFC User Interface. The command "Set Lock Bit" enables the protection. The command "Clear Lock Bit" unlocks the lock region.

Asserting the ERASE pin clears the lock bits, thus unlocking the entire Flash.

8.8.3.5 SAM7S321/32

The Embedded Flash Controller manages 8 lock bits to protect 8 regions of the flash against inadvertent flash erasing or programming commands. The SAM7S321/32 contains 8 lock regions and each lock region contains 32 pages of 128 bytes. Each lock region has a size of 4 Kbytes.

If a locked-region's erase or program command occurs, the command is aborted and the LOCKE bit in the MC_FSR register rises and the interrupt line rises if the LOCKE bit has been written at 1 in the MC_FMR register.

8.8.6 Calibration Bits

Eight NVM bits are used to calibrate the brownout detector and the voltage regulator. These bits are factory configured and cannot be changed by the user. The ERASE pin has no effect on the calibration bits.

8.9 Fast Flash Programming Interface

The Fast Flash Programming Interface allows programming the device through either a serial JTAG interface or through a multiplexed fully-handshaked parallel port. It allows gang-programming with market-standard industrial programmers.

The FFPI supports read, page program, page erase, full erase, lock, unlock and protect commands.

The Fast Flash Programming Interface is enabled and the Fast Programming Mode is entered when the TST pin and the PA0 and PA1 pins are all tied high and PA2 is tied low.

8.10 SAM-BA Boot Assistant

The SAM-BA® Boot Recovery restores the SAM-BA Boot in the first two sectors of the on-chip Flash memory. The SAM-BA Boot recovery is performed when the TST pin and the PA0, PA1 and PA2 pins are all tied high for 10 seconds. Then, a power cycle of the board is mandatory.

The SAM-BA Boot Assistant is a default Boot Program that provides an easy way to program in situ the on-chip Flash memory.

The SAM-BA Boot Assistant supports serial communication through the DBGU or through the USB Device Port. (The SAM7S32/16 have no USB Device Port.)

- Communication through the DBGU supports a wide range of crystals from 3 to 20 MHz via software auto-detection.
- Communication through the USB Device Port is limited to an 18.432 MHz crystal. (

The SAM-BA Boot provides an interface with SAM-BA Graphic User Interface (GUI).

9. System Controller

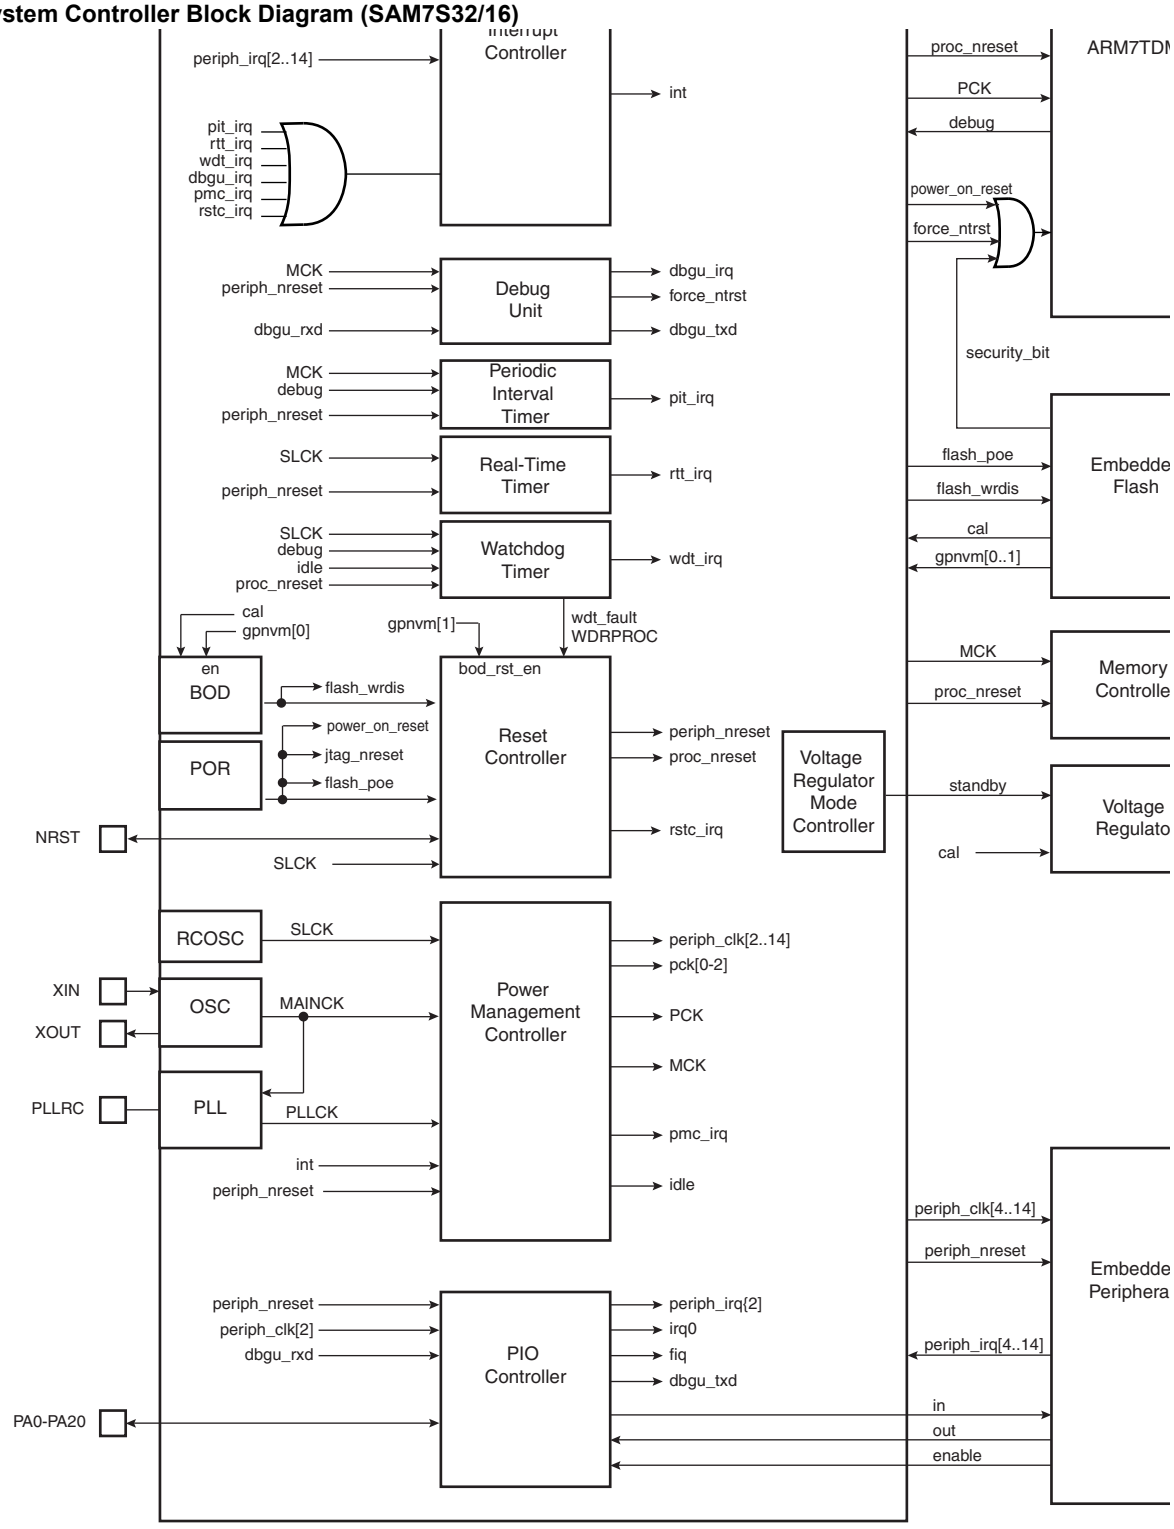
The System Controller manages all vital blocks of the microcontroller: interrupts, clocks, power, time, debug and reset.

The System Controller peripherals are all mapped to the highest 4 Kbytes of address space, between addresses 0xFFFF F000 and 0xFFFF FFFF.

Figure 9-1 on page 26 and Figure 9-2 on page 27 show the product specific System Controller Block Diagrams.

Figure 8-1 on page 20 shows the mapping of the of the User Interface of the System Controller peripherals. Note that the memory controller configuration user interface is also mapped within this address space.

Figure 9-2. System Controller Block Diagram (SAM7S32/16)



9.1 Reset Controller

The Reset Controller is based on a power-on reset cell and one brownout detector. It gives the status of the last reset, indicating whether it is a power-up reset, a software reset, a user reset, a watchdog reset or a brownout reset. In addition, it controls the internal resets and the NRST pin open-drain output. It allows to shape a signal on the NRST line, guaranteeing that the length of the pulse meets any requirement.

Note that if NRST is used as a reset output signal for external devices during power-off, the brownout detector must be activated.

9.1.1 Brownout Detector and Power-on Reset

The SAM7S Series embeds a brownout detection circuit and a power-on reset cell. Both are supplied with and monitor VDDCORE. Both signals are provided to the Flash to prevent any code corruption during power-up or power-down sequences or if brownouts occur on the VDDCORE power supply.

The power-on reset cell has a limited-accuracy threshold at around 1.5V. Its output remains low during power-up until VDDCORE goes over this voltage level. This signal goes to the reset controller and allows a full re-initialization of the device.

The brownout detector monitors the VDDCORE level during operation by comparing it to a fixed trigger level. It secures system operations in the most difficult environments and prevents code corruption in case of brownout on the VDDCORE.

Only VDDCORE is monitored.

When the brownout detector is enabled and VDDCORE decreases to a value below the trigger level (Vbot-, defined as Vbot - hyst/2), the brownout output is immediately activated.

When VDDCORE increases above the trigger level (Vbot+, defined as Vbot + hyst/2), the reset is released. The brownout detector only detects a drop if the voltage on VDDCORE stays below the threshold voltage for longer than about 1µs.

The threshold voltage has a hysteresis of about 50 mV, to ensure spike free brownout detection. The typical value of the brownout detector threshold is 1.68V with an accuracy of ± 2% and is factory calibrated.

The brownout detector is low-power, as it consumes less than 20 µA static current. However, it can be deactivated to save its static current. In this case, it consumes less than 1µA. The deactivation is configured through the GPNVM bit 0 of the Flash.

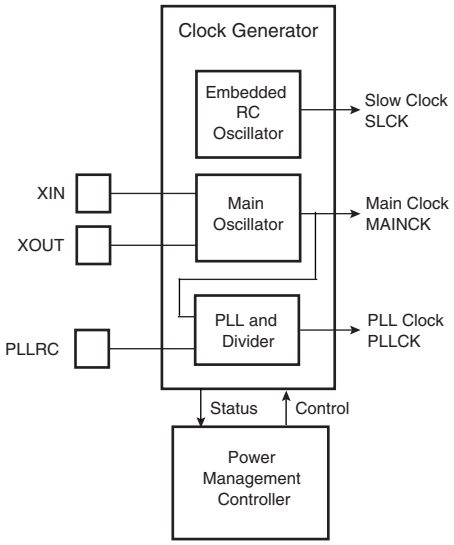
9.2 Clock Generator

The Clock Generator embeds one low-power RC Oscillator, one Main Oscillator and one PLL with the following characteristics:

- RC Oscillator ranges between 22 kHz and 42 kHz
- Main Oscillator frequency ranges between 3 and 20 MHz
- Main Oscillator can be bypassed
- PLL output ranges between 80 and 220 MHz

It provides SLCK, MAINCK and PLLCK.

Figure 9-3. Clock Generator Block Diagram



9.3 Power Management Controller

The Power Management Controller uses the Clock Generator outputs to provide:

- the Processor Clock PCK
- the Master Clock MCK
- the USB Clock UDPCK (not present on SAM7S32/16)
- all the peripheral clocks, independently controllable
- three programmable clock outputs

The Master Clock (MCK) is programmable from a few hundred Hz to the maximum operating frequency of the device.

The Processor Clock (PCK) switches off when entering processor idle mode, thus allowing reduced power consumption while waiting for an interrupt.

- One set of Chip ID Registers
- One Interface providing ICE Access Prevention

- Two-pin UART
  - Implemented features are compatible with the USART
  - Programmable Baud Rate Generator
  - Parity, Framing and Overrun Error
  - Automatic Echo, Local Loopback and Remote Loopback Channel Modes
- Debug Communication Channel Support
  - Offers visibility of COMMRX and COMMTX signals from the ARM Processor
- Chip ID Registers
  - Identification of the device revision, sizes of the embedded memories, set of peripherals
  - Chip ID is 0x270B0A40 for AT91SAM7S512 Rev A
  - Chip ID is 0x270B0A4F for AT91SAM7S512 Rev B
  - Chip ID is 0x270D0940 for AT91SAM7S256 Rev A
  - Chip ID is 0x270B0941 for AT91SAM7S256 Rev B
  - Chip ID is 0x270B0942 for AT91SAM7S256 Rev C
  - Chip ID is TBD for AT91SAM7S256 Rev D
  - Chip ID is 0x270C0740 for AT91SAM7S128 Rev A
  - Chip ID is 0x270A0741 for AT91SAM7S128 Rev B
  - Chip ID is 0x270A0742 for AT91SAM7S128 Rev C
  - Chip ID is TBD for AT91SAM7S128 Rev D
  - Chip ID is 0x27090540 for AT91SAM7S64 Rev A
  - Chip ID is 0x27090543 for AT91SAM7S64 Rev B
  - Chip ID is 0x27090544 for AT91SAM7S64 Rev C
  - Chip ID is 0x27080342 for AT91SAM7S321 Rev A
  - Chip ID is 0x27080340 for AT91SAM7S32 Rev A
  - Chip ID is 0x27080341 for AT91SAM7S32 Rev B
  - Chip ID is 0x27050241 for AT9SAM7S161 Rev A
  - Chip ID is 0x27050240 for AT91SAM7S16 Rev A

Note: Refer to the errata section of the datasheet for updates on chip ID.

9.6 Periodic Interval Timer

- 20-bit programmable counter plus 12-bit interval counter

9.7 Watchdog Timer

- 12-bit key-protected Programmable Counter running on prescaled SCLK
- Provides reset or interrupt signals to the system
- Counter may be stopped while the processor is in debug state or in idle mode

9.8 Real-time Timer

- 32-bit free-running counter with alarm running on prescaled SCLK
- Programmable 16-bit prescaler for SLCK accuracy compensation

9.9 PIO Controller

- One PIO Controller, controlling 32 I/O lines (21 for SAM7S32/16)
- Fully programmable through set/clear registers
- Multiplexing of two peripheral functions per I/O line
- For each I/O line (whether assigned to a peripheral or used as general-purpose I/O)
  - Input change interrupt
  - Half a clock period glitch filter
  - Multi-drive option enables driving in open drain
  - Programmable pull-up on each I/O line
  - Pin data status register, supplies visibility of the level on the pin at any time
- Synchronous output, provides Set and Clear of several I/O lines in a single write

9.10 Voltage Regulator Controller

The aim of this controller is to select the Power Mode of the Voltage Regulator between Normal Mode (bit 0 is cleared) or Standby Mode (bit 0 is set).

Table 10-2. Peripheral Identifiers (SAM7S32/16)

0	AIC	Advanced Interrupt Controller	FIQ
1	SYSC[1]	System	
2	PIOA	Parallel I/O Controller A	
3	Reserved		
4	ADC[1]	Analog-to Digital Converter	
5	SPI	Serial Peripheral Interface	
6	US	USART	
7	Reserved		
8	SSC	Synchronous Serial Controller	
9	TWI	Two-wire Interface	
10	PWMC	PWM Controller	
11	Reserved		
12	TC0	Timer/Counter 0	
13	TC1	Timer/Counter 1	
14	TC2	Timer/Counter 2	
15 - 29	Reserved		
30	AIC	Advanced Interrupt Controller	IRQ0
31	Reserved		

10.3 Peripheral Multiplexing on PIO Lines

The SAM7S Series features one PIO controller, PIOA, that multiplexes the I/O lines of the peripheral set.

PIO Controller A controls 32 lines (21 lines for SAM7S32/16). Each line can be assigned to one of two peripheral functions, A or B. Some of them can also be multiplexed with the analog inputs of the ADC Controller.

Table 10-3, “Multiplexing on PIO Controller A (SAM7S512/256/128/64/321/161),” on page 35 and Table 10-4, “Multiplexing on PIO Controller A (SAM7S32/16),” on page 36 define how the I/O lines of the peripherals A, B or the analog inputs are multiplexed on the PIO Controller A. The two columns “Function” and “Comments” have been inserted for the user’s own comments; they may be used to track how pins are defined in an application.

Note that some peripheral functions that are output only may be duplicated in the table.

All pins reset in their Parallel I/O lines function are configured as input with the programmable pull-up enabled, so that the device is maintained in a static state as soon as a reset is detected.

10.5 Serial Peripheral Interface

- Supports communication with external serial devices
  - Four chip selects with external decoder allow communication with up to 15 peripherals
  - Serial memories, such as DataFlash® and 3-wire EEPROMs
  - Serial peripherals, such as ADCs, DACs, LCD Controllers, CAN Controllers and Sensors
  - External co-processors
- Master or slave serial peripheral bus interface
  - 8- to 16-bit programmable data length per chip select
  - Programmable phase and polarity per chip select
  - Programmable transfer delays between consecutive transfers and between clock and data per chip select
  - Programmable delay between consecutive transfers
  - Selectable mode fault detection
  - Maximum frequency at up to Master Clock

10.6 Two-wire Interface

- Master Mode only (SAM7S512/256/128/64/321/32)
- Master, Multi-Master and Slave Mode support (SAM7S161/16)
- General Call supported in Slave Mode (SAM7S161/16)
- Compatibility with I^2C compatible devices (refer to the TWI sections of the datasheet)
- One, two or three bytes internal address registers for easy Serial Memory access
- 7-bit or 10-bit slave addressing
- Sequential read/write operations

10.7 USART

- Programmable Baud Rate Generator
- 5- to 9-bit full-duplex synchronous or asynchronous serial communications
  - 1, 1.5 or 2 stop bits in Asynchronous Mode
  - 1 or 2 stop bits in Synchronous Mode
  - Parity generation and error detection
  - Framing error detection, overrun error detection
  - MSB or LSB first
  - Optional break generation and detection
  - By 8 or by 16 over-sampling receiver frequency
  - Hardware handshaking RTS - CTS
  - Modem Signals Management DTR-DSR-DCD-RI on USART1 (not present on SAM7S32/16)
  - Receiver time-out and transmitter timeguard
  - Multi-drop Mode with address generation and detection
- RS485 with driver control signal
- ISO7816, T = 0 or T = 1 Protocols for interfacing with smart cards
  - NACK handling, error counter with repetition and iteration limit
- IrDA modulation and demodulation
  - Communication at up to 115.2 Kbps
- Test Modes
  - Remote Loopback, Local Loopback, Automatic Echo

AT91SAM7S512-AU AT91SAM7S512-MU	AT91SAM7S512B-AU AT91SAM7S512B-MU	–	–	LQFP 64 QFN 64	Green	Industrial (-40· C to 85· C)

Revision History

6175AS	First issue - Unqualified on Intranet Corresponds to 6175A full datasheet approval loop. Qualified on Intranet.	
6175BS	Section 8. “Memories” on page 18 updated: 2 ms => 3 ms, 10 ms => 15 ms, 4 ms => 6 ms	CSR05-529
6175CS	Section 12. ”SAM7S Ordering Information” AT91SAM7S321 changed in Table 12-1 on page 47	#2342
6175DS	“Features” , Table 1-1, “Configuration Summary,” on page 3, Section 4. ”Package and Pinout” Section 12. ”SAM7S Ordering Information” QFN package information added	#2444
6175ES	Section 10.11 on page 39 USB Device port, Ping-pong Mode includes Isochronous endpoints. “Features” on page 1, and global: AT91SAM7S512 added to series. Reference to Manchester Encoder removed from USART. Section 8. ”Memories” Reformatted Memories, Consolidated Memory Mapping in Figure 8-1 on page 20 Section 10. ”Peripherals” Reordered sub sections. Section 11. ”Package Drawings” QFN, LQFP package drawings added. “ice_nreset” signals changed to” power_on_reset” in System Controller block diagrams, Figure 9-1 on page 26 and Figure 9-2 on page 27. Section 4. ”Package and Pinout” LQFP and QFN Package Outlines replace Mechanical Overview. Section 10.1 ”User Interface”, User peripherals are mapped between 0xF000 0000 and 0xFFFF EFFF. SYSIRQ changed to SYSC in “Peripheral Identifiers” Table 10-1 and Table 10-2	specs #2748 #2832 (DBGU IP) rfo review
6175FS	AT91SAM7S161 and AT91SAM7S16 added to product family **Features:** Timer Counter, on page 2 product specific information rewritten, Table 1-1, “Configuration Summary,” on page 3, footnote explains TC on AT91SAM7S32/16 has only two channels accessible via PIO, and in Section 10.9 ”Timer Counter”, precisions added to “compare and capture” output/input. Section 10.6 ”Two-wire Interface”, updated reference to I^2C compatibility, internal address registers, slave addressing, Modes for AT91SAM7S161/16 “One Two-wire Interface (TWI)” on page 2, updated in Features Section 10.12 ”Analog-to-digital Converter”, updated Successive Approximation Register ADC and the INL, DNL ± values of LSB. Section 8.8.3 ”Lock Regions”, locked-region’s erase or program command updated Section 9.5 ”Debug Unit”, Chip ID updated. Section 6. ”I/O Lines Considerations”, JTAG Port Pin, Test Pin, Erase Pin, updated.	BDs 4208 rfo review 4325 5063

6175GS	“Features” ,“Debug Unit (DBGU)” updated with “Mode for General Purpose 2-wire UART Serial Communication” Section 7.4 ”Peripheral DMA Controller”, added list of PDC priorities. Section 9. ”System Controller”, Figure 9-1 and Figure 9-2 RTT is reset by “power_on_reset”. Section 9.1.1 ”Brownout Detector and Power-on Reset”, fourth paragraph reduced. Section 9.5 ”Debug Unit”, the list; Section I ”Chip ID Registers”, chip IDs updated, added SAM7S32 Rev B and SAM7S64 Rev B to the list. Section 12. ”SAM7S Ordering Information”, Updated product ordering information by MRL A and MRL B versions.	5846 5913 5224 5685 rfo
6175HS	Section 6.2 ”Test Pin”, added to SAM-BA Boot recovery procedure, a power cycle of the board is mandatory. Section 8.10 ”SAM-BA Boot Assistant”, added to SAM-BA Boot recovery procedure, a power cycle of the board is mandatory.	6068
6175IS	Section 9.5 ”Debug Unit”, Chip ID Registers list updated. MRL C column added to Table 12-1, “SAM7S Series Ordering Information”.	7185
6175JS	Product Series Naming Convention Except for part ordering and library references, AT91 prefix dropped from most nomenclature. AT91SAM7S becomes SAM7S. Debug Unit: “Chip ID Registers” on page 31, Chip ID is 0x270B0A4F for AT91SAM7S512 Rev B	rfo 7945
6175KS	Section 9.5 ”Debug Unit”, Chip ID Registers list updated. Added Chip ID for SAM7S128 Rev D and SAM7S256 Rev D Table 12-1, “SAM7S Series Ordering Information”.Added SAM7S128 Rev D and SAM7S256 Rev D	8380/8467
