Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

DC Characteristics

Supply Current and Power Consumption

Intel offers two ways to estimate power for your design—the Excel-based Early Power Estimator (EPE) and the Intel Quartus Prime Power Analyzer feature.

Use the Excel-based EPE before you start your design to estimate the supply current for your design. The EPE provides a magnitude estimate of the device power because these currents vary greatly with the usage of the resources.

The Intel Quartus Prime Power Analyzer provides better quality estimates based on the specifics of the design after you complete place-and-route. The Power Analyzer can apply a combination of user-entered, simulation-derived, and estimated signal activities that, when combined with detailed circuit models, yield very accurate power estimates.

I/O Pin Leakage Current

The values in the table are specified for normal device operation. The values vary during device power-up. This applies for all V_{CCIO} settings (3.3, 3.0, 2.5, 1.8, 1.5, 1.35, and 1.2 V).

10 µA I/O leakage current limit is applicable when the internal clamping diode is off. A higher current can be the observed when the diode is on.

Input channel leakage of ADC I/O pins due to hot socket is up to maximum of 1.8 mA. The input channel leakage occurs when the ADC IP core is enabled or disabled. This is applicable to all Intel MAX 10 devices with ADC IP core, which are 10M04, 10M08, 10M16, 10M25, 10M40, and 10M50 devices. The ADC I/O pins are in Bank 1A.

Figure 1. Equation for OCT Resistance after Calibration at Device Power-Up

$$\Delta R_V = (V_2 - V_1) \times 1000 \times dR/dV$$

$$\Delta R_T = (T_2 - T_1) \times dR/dT$$

$$\text{For } \Delta R_X < 0; MF_X = 1/(|\Delta R_X|/100 + 1)$$

$$\text{For } \Delta R_X > 0; MF_X = \Delta R_X/100 + 1$$

$$MF = MF_V \times MF_T$$

$$R_{final} = R_{initial} \times MF$$

The definitions for equation are as follows:

- T_1 is the initial temperature.
- T_2 is the final temperature.
- MF is multiplication factor.
- $R_{initial}$ is initial resistance.
- R_{final} is final resistance.

(10) ADC pins are only available at left I/O banks.

(11) When V_{REF} pin is used as regular input or output, F_{max} performance is reduced due to higher pin capacitance. Using the V_{REF} pin capacitance specification from device datasheet, perform SI analysis on your board setup to determine the F_{max} of your system.

(12) 10M40 and 10M50 devices have dual purpose clock input pins at top/bottom I/O banks.

I/O Standards Specifications

Tables in this section list input voltage (V_{IH} and V_{IL}), output voltage (V_{OH} and V_{OL}), and current drive characteristics (I_{OH} and I_{OL}) for various I/O standards supported by Intel MAX 10 devices.

For minimum voltage values, use the minimum V_{CCIO} values. For maximum voltage values, use the maximum V_{CCIO} values.

You must perform timing closure analysis to determine the maximum achievable frequency for general purpose I/O standards.

Table 22. Single-Ended SSTL, HSTL, and HSUL I/O Standards Signal Specifications for Intel MAX 10 Devices

(29) The VCO frequency reported by the Intel Quartus Prime software in the PLL summary section of the compilation report takes into consideration the VCO post-scale counter K value. Therefore, if the counter K has a value of 2, the frequency reported can be lower than the f_{VCO} specification.

(30) A high input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean clock source, which is less than 200 ps.

(31) Peak-to-peak jitter with a probability level of 10^{-12} (14 sigma, 99.99999999974404% confidence level). The output jitter specification applies to the intrinsic jitter of the PLL, when an input jitter of 30 ps is applied.
