Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	68000
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	20MHz
Co-Processors/DSP	-
RAM Controllers	-
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	-
SATA	-
USB	-
Voltage - I/O	5.0V
Operating Temperature	-55°C ~ 125°C (TC)
Security Features	-
Package / Case	114-BCPGA
Supplier Device Package	114-CPGA (34.54x34.54)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/ts68020mr20

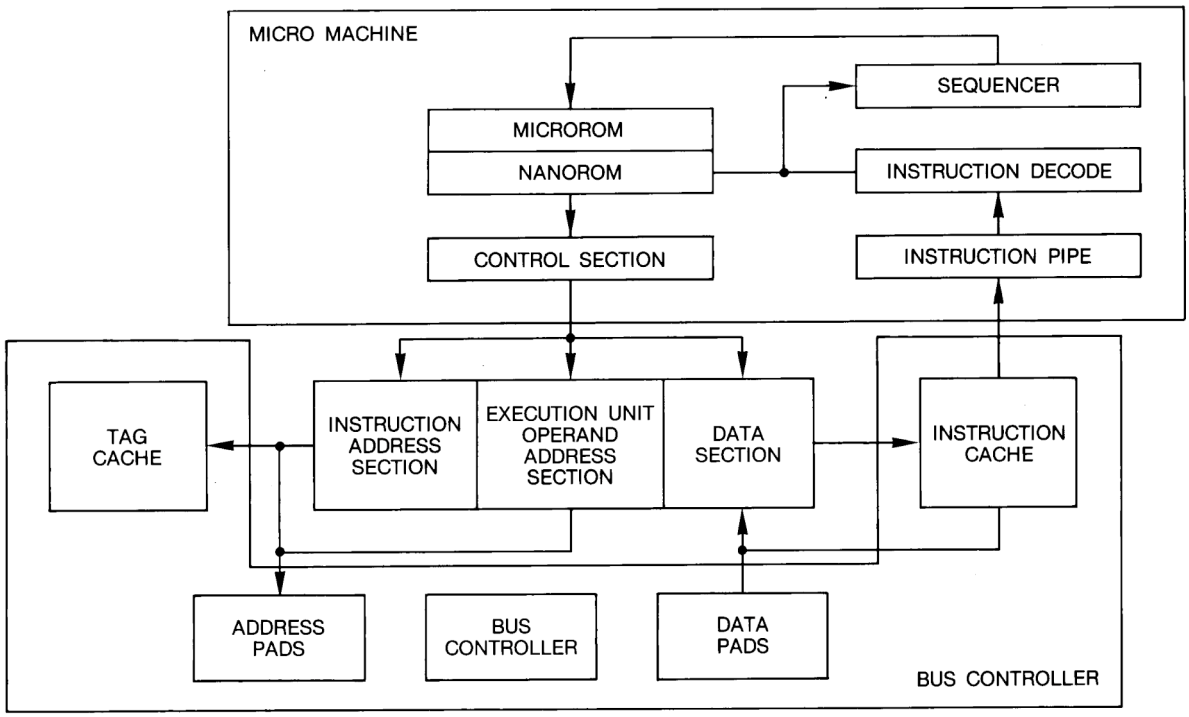
Introduction

The TS68020 is a high-performance 32-bit microprocessor. It is the first microprocessor to have evolved from a 16-bit machine to a full 32-bit machine that provides 32-bit address and data buses as well as 32-bit internal structures. Many techniques were utilized to improve performance and at the same time maintain compatibility with other processors of the TS68000 Family. Among the improvements are new addressing modes which better support high-level language structures, an expanded instruction set which provides 32-bit operations for the limited cases not supported by the TS68000 and several new instructions which support new data types. For special-purpose applications when a general-purpose processor alone is not adequate, a co-processor interface is provided.

The TS68020 is a high-performance microprocessor implemented in HCMOS, low power, small geometry process. This process allows CMOS and HMOS (high density NMOS) gates to be combined on the same device. CMOS structures are used where speed and low power is required, and HMOS structures are used where minimum silicon area is desired. This technology enables the TS68020 to be very fast while consuming less power (less than 1.5 watts) and still have a reasonably small die size. It utilizes about 190.000 transistors, 103.000 of which are actually implemented. The package is a pin-grid array (PGA) with 114 pins, arranged 13 pins on a side with a depopulated center and 132 pins ceramic quad flat pack.

Figure 1 is a block diagram of the TS68020. The processor can be divided into two main sections: the bus controller and the micromachine. This division reflects the autonomy with which the sections operate.

Figure 1. TS68020 Block Diagram



The bus controller consists of the address and data pads and multiplexers required to support dynamic bus sizing, a macro bus controller which schedules the bus cycles on the basis of priority with two state machines (one to control the bus cycles for operated accesses and the other to control the bus cycles for instruction accesses), and the instruction cache with its associated control.

The micromachine consists of an execution unit, nanorom and microrom storage, an instruction decoder, an instruction pipe, and associated control sections. The execution unit consists of an address section, an operand address section, and a data section. Microcode control is provided by a modified two-level store of microrom and nanorom. Programmed logical arrays (PLAs) are used to provide instruction decode and sequencing information. The instruction pipe and other individual control sections provide the secondary decode of instructions and generated the actual control signals that result in the decoding and interpretation of nanorom and micorom information.

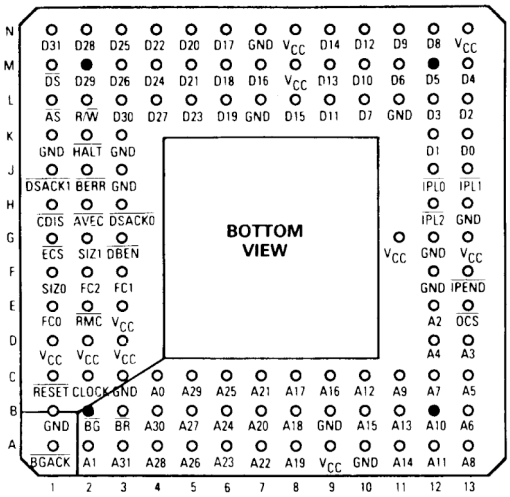

Figure 3. CQFP Terminal Designation

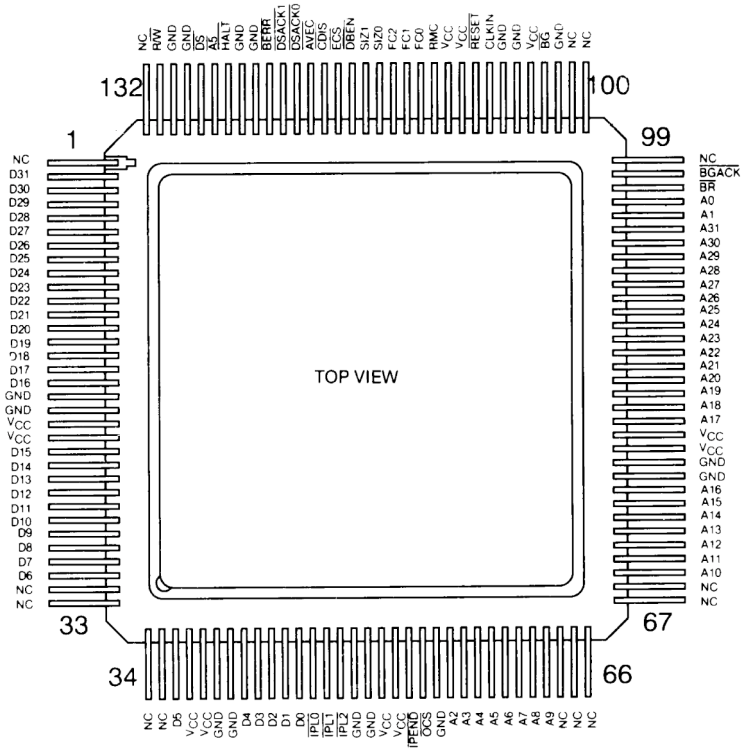

Detailed Specifications

Scope

This drawing describes the specific requirements for the microprocessor 68020, 16.67 MHz, 20 MHz and 25 MHz, in compliance with the MIL-STD-883 class B.

Applicable Documents

MIL-STD-883

- MIL-STD-883: Test Methods and Procedures for Electronics
- MIL-PRF-38535 appendix A: General Specifications for Microcircuits
- Desc Drawing 5962 - 860320xxx

Requirements

General

The microcircuits are in accordance with the applicable document and as specified herein.

Design and Construction

Terminal Connections

Depending on the package, the terminal connections shall be as shown in Figure 2 and Figure 3.

Lead Material and Finish

Lead material and finish shall be any option of MIL-STD-1835.

Package

The macrocircuits are packages in hermetically sealed ceramic packages which are conform to case outlines of MIL-STD-1835 (when defined):

- 114-pin SQ.PGA UP PAE Outline
- 132-pin Ceramic Quad Flat Pack CQFP

The precise case outlines are described on Figure 23 and Figure 24.

For dynamic characteristics (Table 6), test methods refer to IEC 748-2 method, where existing.

Indication of “min.” or “max.” in the column “test temperature” means minimum or maximum operating temperature.

Table 5. Static Characteristics. V_{CC} = 5.0V_{DC} ± 10%; GND = 0V_{DC}; T_c = -55/+125°C or -40/+85°C (Figure 4 to Figure 8)

Symbol	Parameter	Condition	Min	Max	Units
I_{CC}	Maximum Supply Current	V_{CC} = 5.5V T_{case} -55°C to +25°C		333	mA
I_{CC}	Maximum Supply Current	V_{CC} = 5.5V T_{case} = 125°C		207	mA
V_{IH}	High Level Input Voltage	V_O = 0.5V or 2.5 V_{CC} = 4.5V to 5.5V	2.0	V_{CC}	V
V_{IL}	Low Level Input Voltage	V_O = 0.5V or 2.4V V_{CC} = 4.5V to 5.5V	-0.5	0.8	V
V_{OH}	High Level Output Voltage All Outputs	I_{OH} = 400 µA	2.4		V
V_{OL}	Low Level Output Voltage Outputs A0-A31, FC0-FC2, D0-D31, SIZ0-SIZ1, $\overline{BG}$	I_{OL} = 3.2 mA Load Circuit as Figure 8 R = 1.22 kΩ		0.5	V
V_{OL}	Low Level Output Voltage Outputs $\overline{AS}$, $\overline{DS}$, $\overline{RMC}$, R/$\overline{W}$, $\overline{DBEN}$, $\overline{IPEND}$	I_{OL} = 5.3 mA Load Circuit as Figure 8 R = 740Ω		0.5	V
V_{OL}	Low Level Output Voltage Outputs $\overline{ECS}$, $\overline{OCS}$	I_{OL} = 2.0 mA Load Circuit as Figure 8 R = 2 kΩ		0.5	V
V_{OL}	Low Level Output Voltage Outputs $\overline{HALT}$, $\overline{RESET}$	I_{OL} = 10.7 mA Load Circuit as Figure 6 and Figure 7		0.5	V
$\lvert I_{IN} \rvert$	Input Leakage Current (High and Low State)	-0.5V ≤ V_{IN} ≤ V_{CC} (Max)		2.5	µA
$\lvert I_{OHZ} \rvert$	High level leakage current at three-state outputs Outputs A0-A31, $\overline{AS}$, $\overline{DBEN}$, $\overline{DS}$, D0-D31, R/$\overline{W}$, FC0-FC2, $\overline{RMC}$, SIZ0-SIZ1	V_{OH} = 2.4V		2.5	µA
$\lvert I_{OLZ} \rvert$	Low Level Leakage Current at Three-state Outputs Outputs A0-A31, $\overline{AS}$, $\overline{DBEN}$, $\overline{DS}$, D0-D31 R/$\overline{W}$, FC0-FC2, $\overline{RMC}$, SIZ0-SIZ1	V_{OL} = 0.5V		2.5	µA
I_{OS}	Output Short-circuit Current (Any Output)	V_{CC} = 5.5V V_O = 0V (Pulsed. Duration 1 ms Duty Cycle 10:1)		200	mA

Test Conditions Specific to the Device

Loading Network

The applicable loading network shall be defined in column “Test conditions” of Table 6, referring to the loading network number as shown in Figure 6, Figure 7, Figure 8 below.

Figure 6. RESET Test Loads

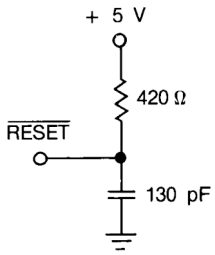

Figure 7. HALT Test Load

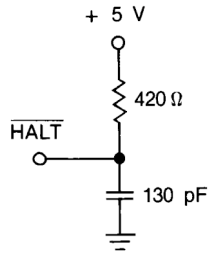

Figure 8. Test Load

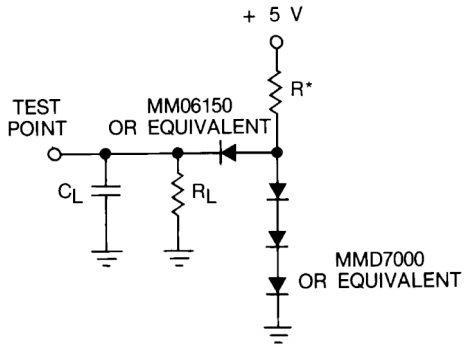

Table 7. Load Network

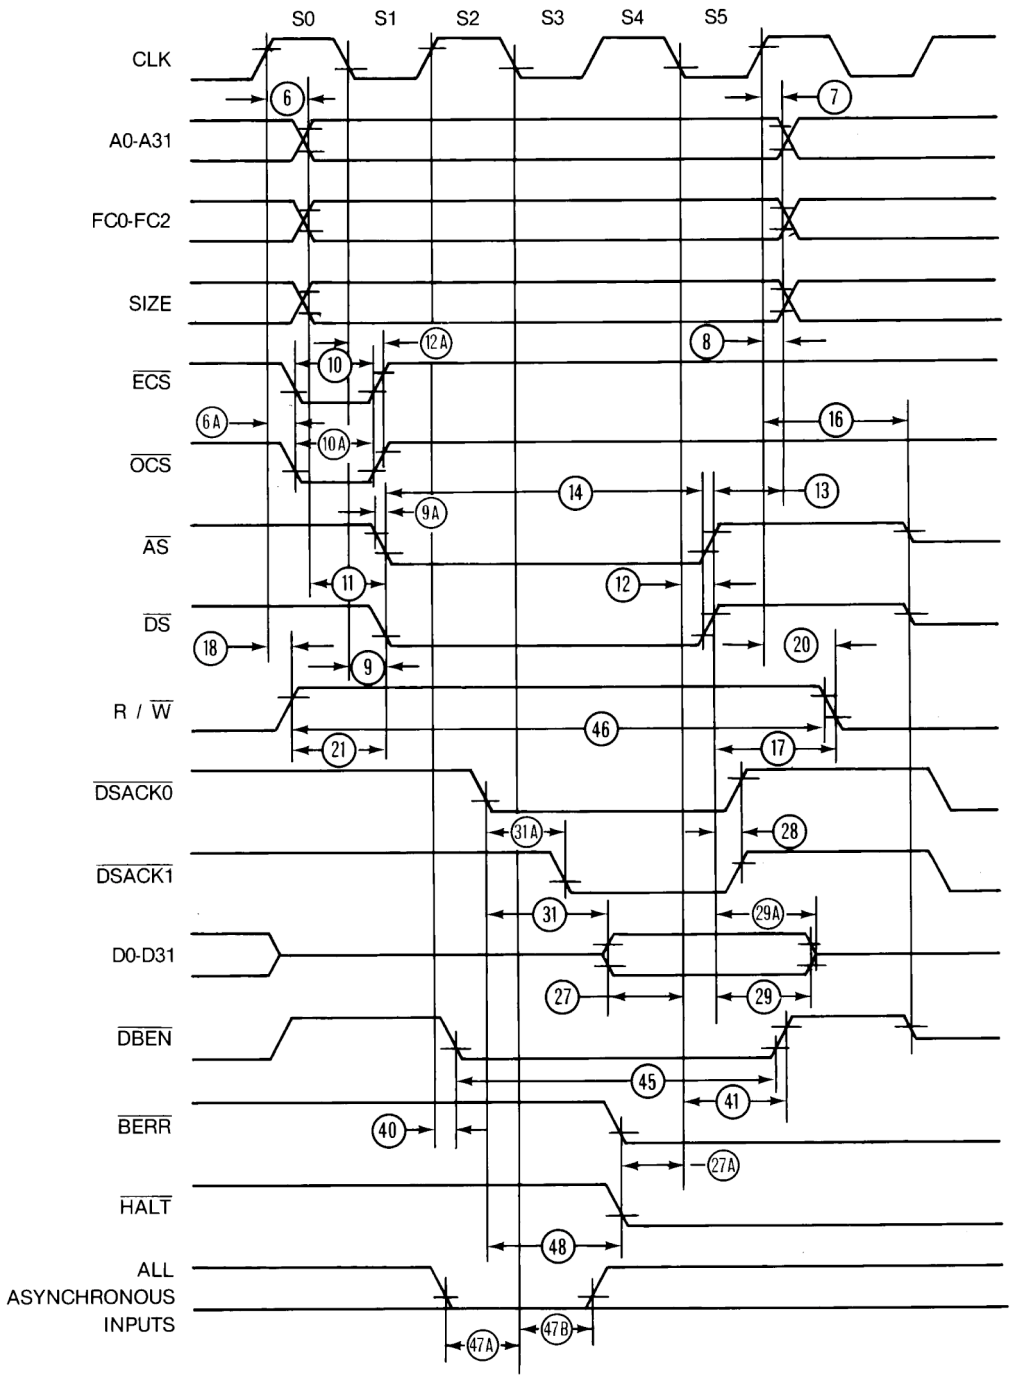
Load NBR	Figure	R	R_L	C_L	Output Application
1	7	2 k	6.0 k	50 pF	$\overline{OCS}$, $\overline{ECS}$
2	7	1.22 k	6.0 k	130 pF	A0-A31, D0-D31, $\overline{BG}$, FC0-FC2, SIZ0-SIZ1
3	7	0.74 k	6.0 k	130 pF	$\overline{AS}$, $\overline{DS}$, R/$\overline{W}$, $\overline{RMC}$, $\overline{DBEN}$, $\overline{IPEND}$

Note: 1. Equivalent loading may be simulated by the tester.

Time Definitions

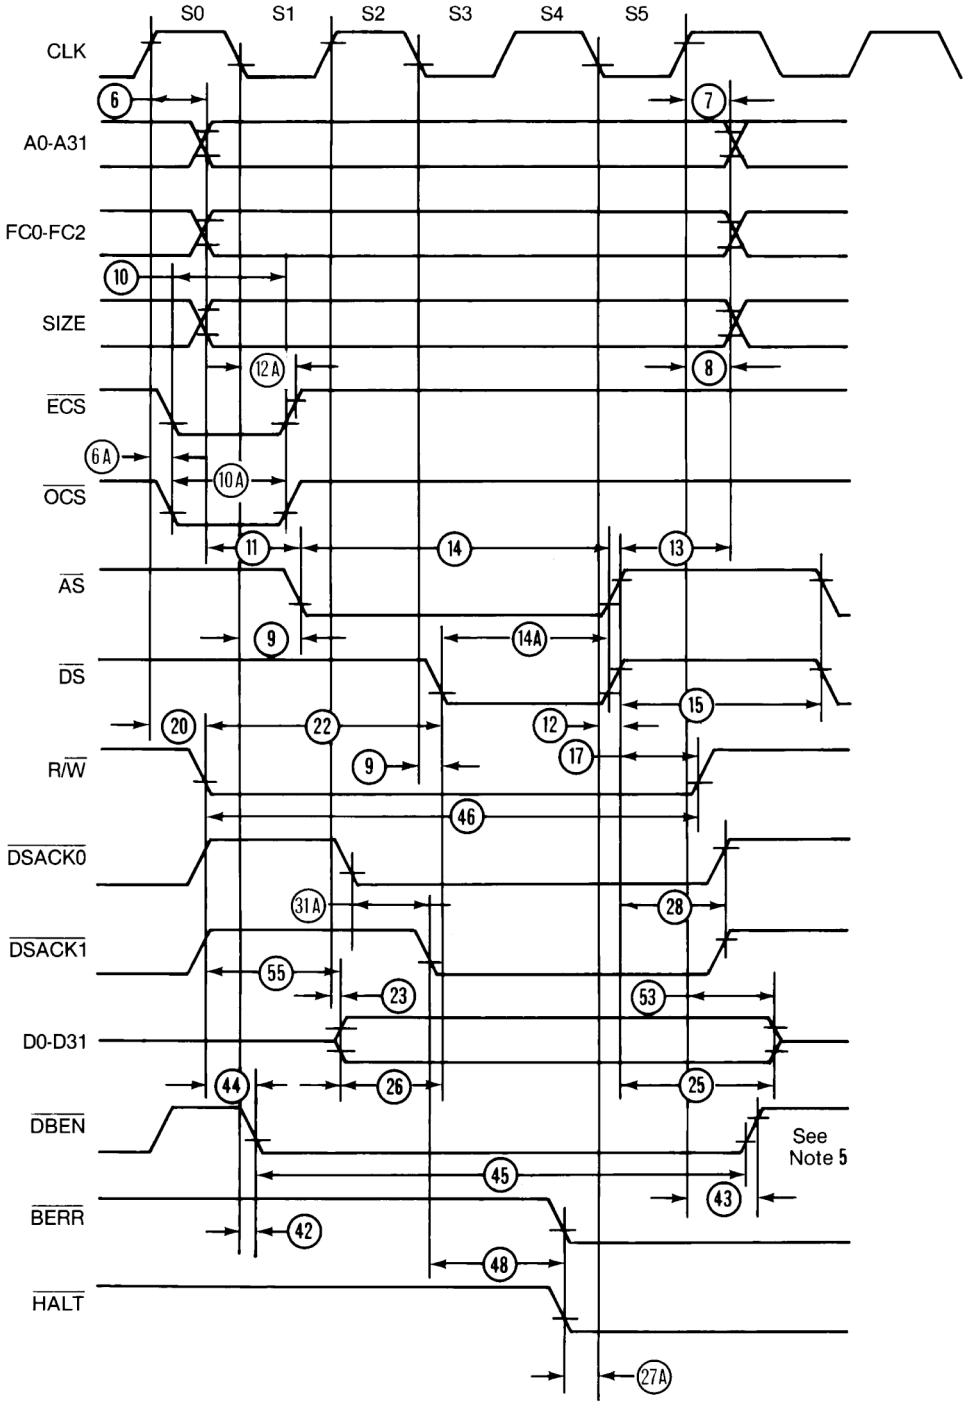
The times specified in Table 6 as dynamic characteristics are defined in Figure 9 below, by a reference number given the column “interval N°” of the tables together with the relevant figure number.

Figure 9. Read Cycle Timing Diagram



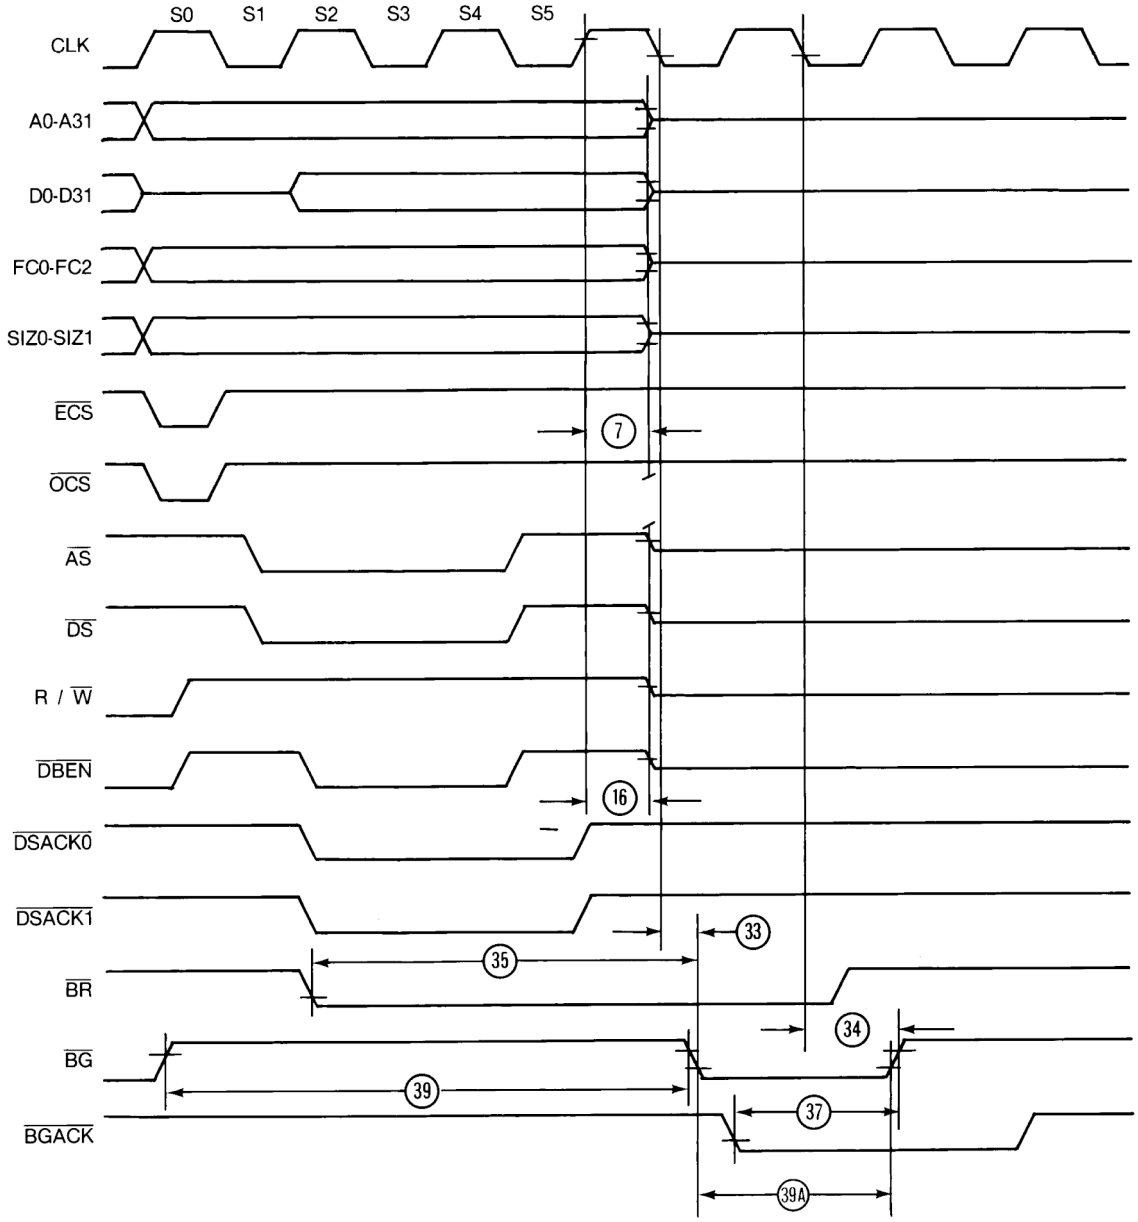
Note: Timing measurements are referenced to and from a low voltage of 0.8V and a high voltage of 2.0V, unless otherwise noted. The voltage swing through this range should start outside and pass through the range such that the rise or fall will be linear between 0.8V and 2.0V.

Figure 10. Write Cycle Timing Diagram (Continued)



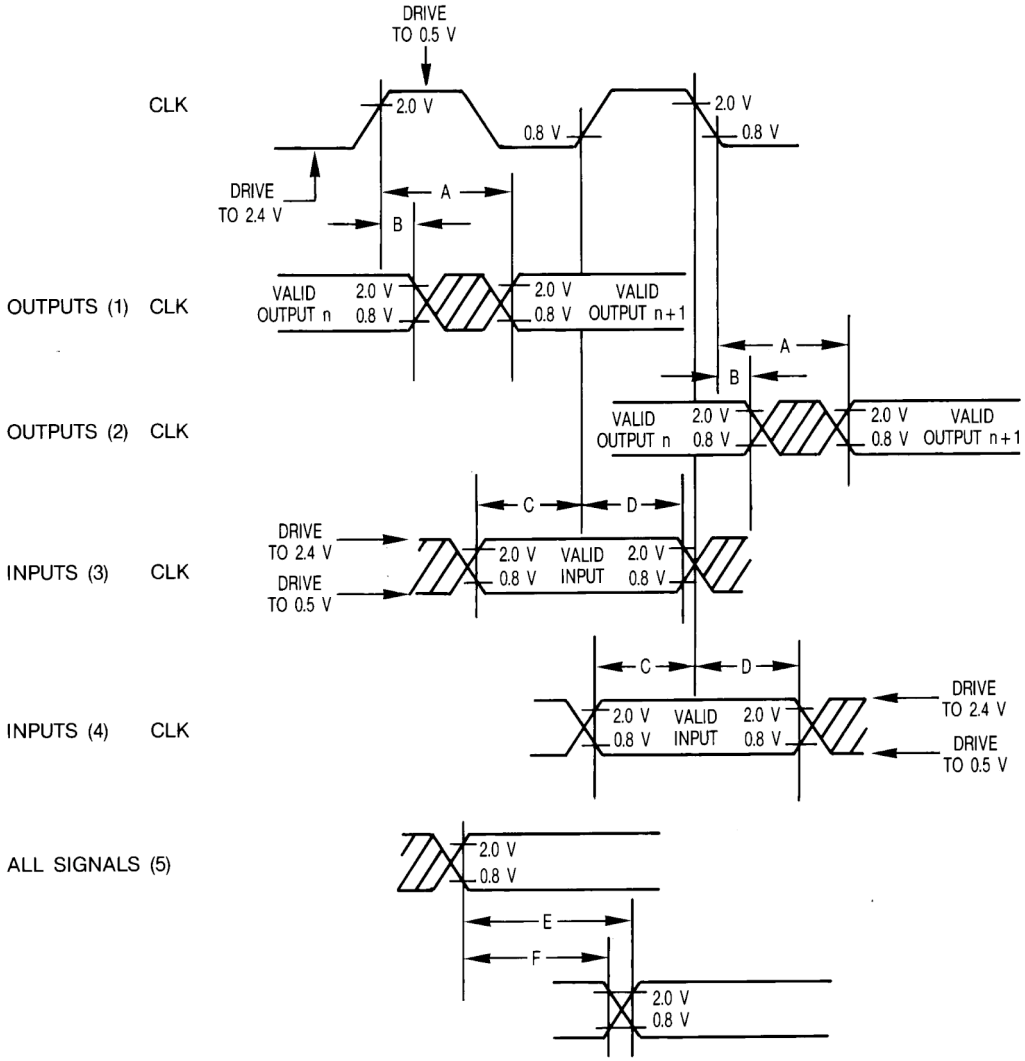
Note: Timing measurements are referenced to and from a low voltage of 0.8V and a high voltage of 2.0V, unless otherwise noted. The voltage swing thorough this range should start outside and pass through the range such that the rise or fall will be linear between 0.8V and 2.0V.

Figure 11. Bus Arbitration Timing Diagram



Note: Timing measurements are referenced to and from a low voltage of 0.8V and a high voltage of 2.0V, unless otherwise noted. The voltage swing thorough this range should start outside and pass through the range such that the rise or fall will be linear between 0.8V and 2.0V.

Figure 12. Drive Levels and Test Points for AC Specification



Legend:

A) Maximum Output Delay Specification

B) Minimum Output Hold Time

C) Minimum Input Setup Time Specification

D) Minimum Input Hold Time Specification

E) Signal Valid to Signal Valid Specification (Maximum or Minimum)

F) Signal Valid to Signal Invalid Specification (Maximum or Minimum)

Notes:
1. This output timing is applicable to all parameters specified relative to the rising edge of the clock.
2. This out put timing is applicable to all parameters specified relative to the falling edge of the clock.
3. This input timing is applicable to all parameters specified relative to the falling edge of the clock.
4. This input timing is applicable to all parameters specified relative to the falling edge of the clock.
5. This timing is applicable to all parameters specified relative to the assertion/negation of another signal.

Figure 14. ECS and OCS Capacitance Derating Curve

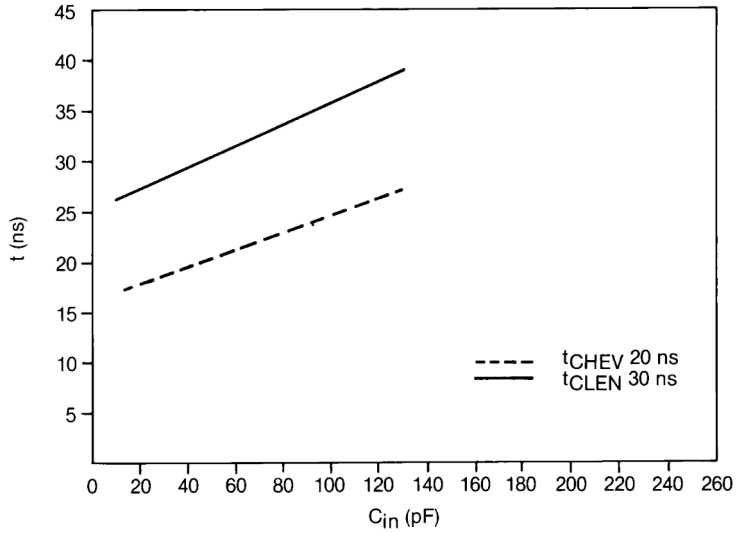


Figure 15. R/W, FC, SIZ0-SIZ1, and RMC Capacitance Derating Curve

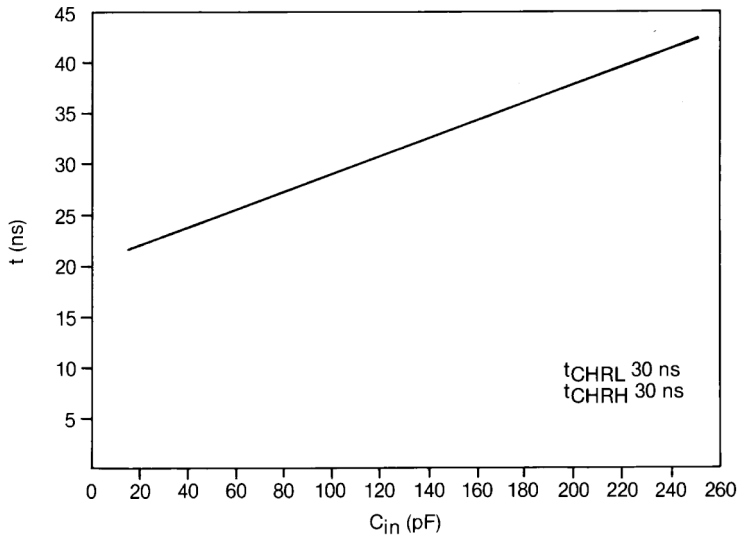

The TS68000 Family processors distinguish address spaces as supervisor / used and program/data. These four combinations are specified by the function code pins (FC0/FC1/FC2) during bus cycles, indication the particular address space. Using the function codes, the memory sub-system can distinguish between authorized access (supervisor mode is privileged access) and unauthorized access (user mode may not have access to supervisor program or data areas). To support the full privileges of the supervisor, the alternate function code registers allow the supervisor to specify an access to user program or data areas by preloading the SFC/DFC registers appropriately.

The cache registers (control — CACR, address — CAAR) allow software manipulation of the on-chip instruction cache. Control and status accesses to the instruction cache are provided by the cache control register (CACR), while the cache address register (CAAR) holds the address for those cache control functions that require an address.

Figure 19. User Programming Model

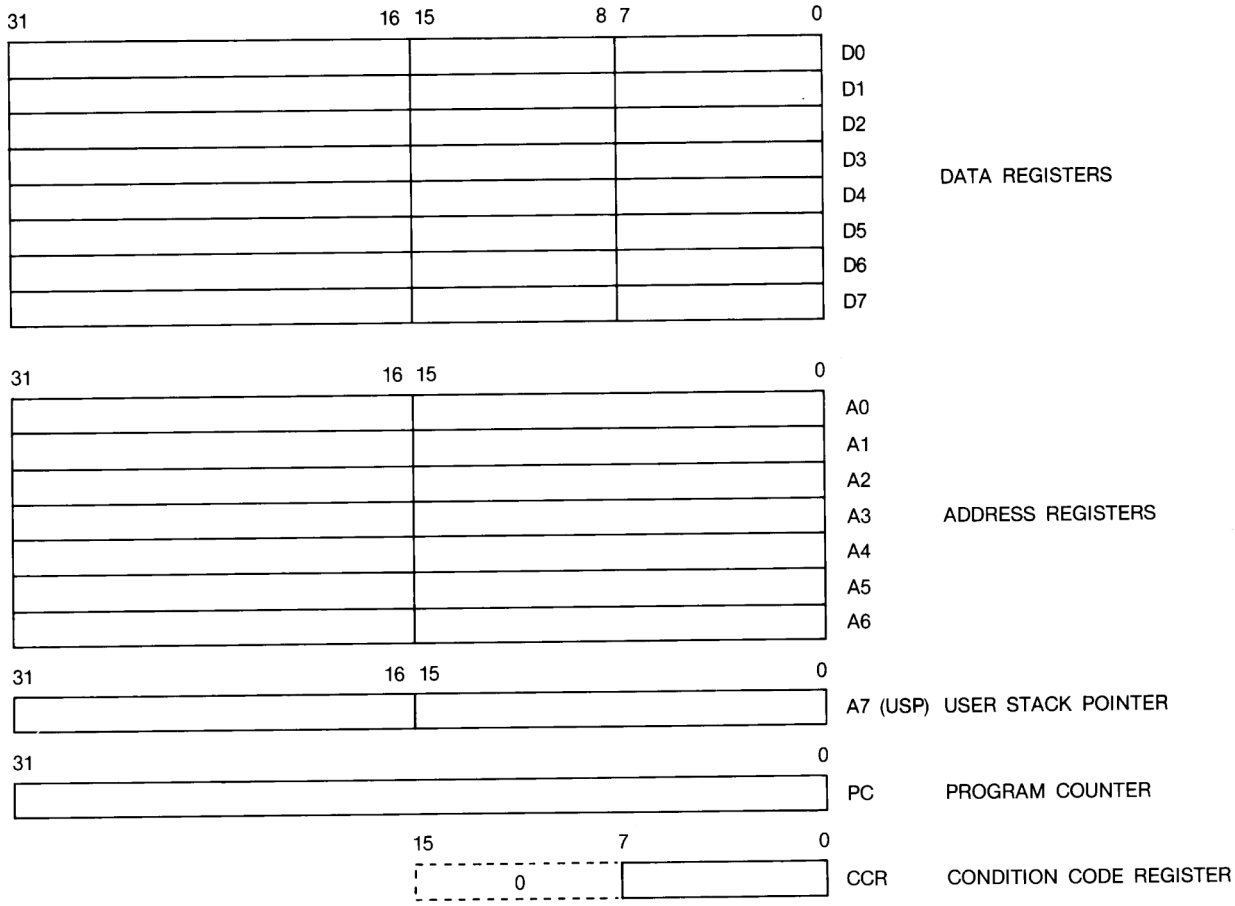

Figure 20. Supervisor Programming Model Supplement

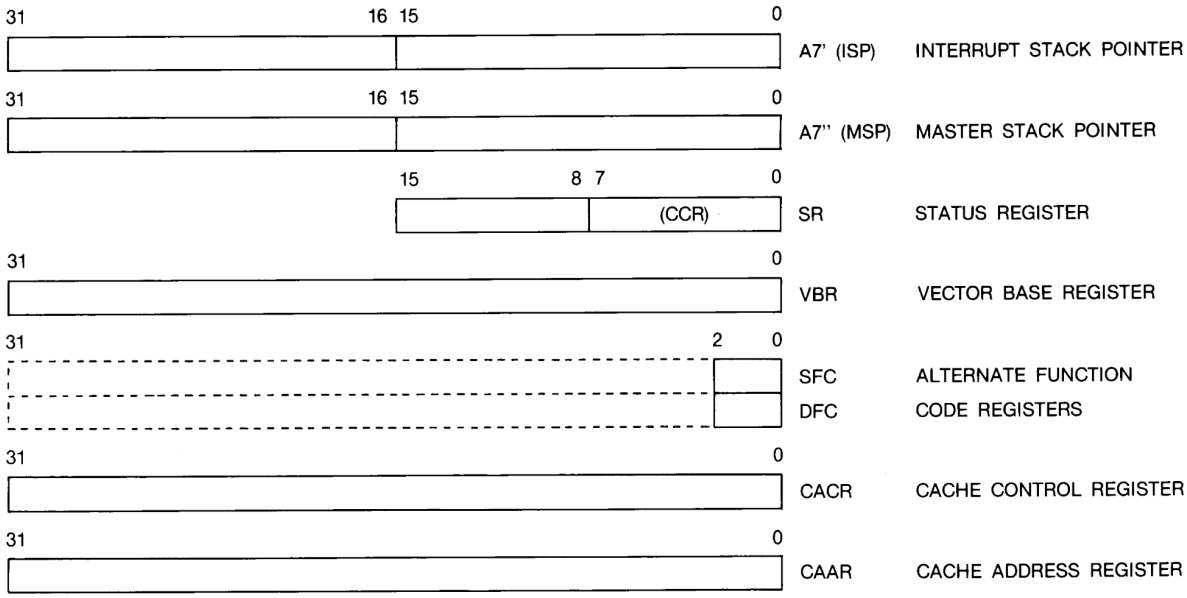

Figure 21. Status Register

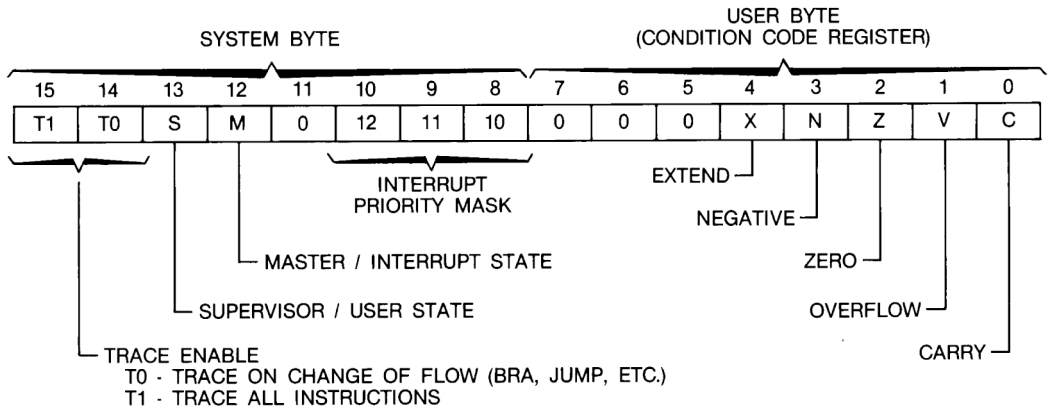

Data Types and Addressing Modes

Seven basic types are supported. These data types are:

- Bits
- Bits Flieds (String of consecutive bits, 1-32 bits long)
- BCD Digits (Packed: 2 digits/byte, Unpacked: 1 digit/byte)
- Byte Integers (8-bit)
- Word Integers (16-bit)
- Long Word Integers (32-bit)
- Quad Word Integers (64-bit)

In addition, operations on other data types, such as memory addresses, status word data, etc...., are provided in the instruction set. The co-processor mechanism allows direct support of floating-point data type with the TS68881 and TS68882 floating-point co-processors, as well as specialized user-defined data types and functions.

The 18 addressing modes, shown in Table 8, include nine basic types:

- Register Direct
- Register Indirect
- Register Indirect with Index
- Memory Indirect
- Program Counter Indirect with Displacement
- Program Counter Indirect with Index
- Program Counter Memory Indirect
- Absolute
- Immediate

The register indirect addressing modes support postincrement, predecrement, offset, and indexing. Programmers find these capabilities particularly useful for handling advanced data structures common to sophisticated applications and high level languages. The program counter relative mode also has index and offset capabilities; programmers find that this addressing mode is required to support position-independent software. In addition to these addressing modes, the TS68020 provides data operand sizing and scaling; these features provide performance enhancements to the programmer.

Table 8. TS68020 Addressing Modes

Addressing Modes	Syntax
Register Direct	
Data Register Direct	Dn
Address Register Direct	An
Register Indirect	
Address Register Indirect	(An)
Address Register Indirect with Post Increment	(An) +
Address Register Indirect with Predecrement	– (An)
Address Register Indirect with Displacement	(d_{16}An)
Register Indirect with Index	
Address Register Indirect with Index (8-bit Displacement)	(d_8, An, Xn)
Address Register Indirect with Index (Base Displacement)	(bd, An, Xn)
Memory Indirect	
Memory Indirect Post-Indexed	([bd, An], Xn, od)
Memory Indirect Pre-Indexed	([bd, An, Xn], od)
Program Counter Indirect with Displacement	(d_{16}, PC)
Program Counter Indirect with Index	
PC Indirect with Index (8-bit Displacement)	(d_8, PC, Xn)
PC Indirect with Index (Base Displacement)	(bd, PC, Xn)
Program Counter Memory Indirect	
PC Memory Indirect Post-Indexed	([bd, PC], Xn, od)
PC Memory Indirect Pre-Indexed	([bd, PC, Xn]), od)

Table 8. TS68020 Addressing Modes (Continued)

Addressing Modes	Syntax
Absolute	
Absolute Short	xxx.W
Absolute Long	xxx.L
Immediate	=data

Notes:
1. Dn = Data Register, D0-D7.
2. An = Address Register, A0-A7.
3. d_8, d_{16} = A twos-complement, or sign—extended displacement; added as part of the effective calculation; size is 8 (d_8) or 16 (d_{16}) bits; when omitted assemblers use a value of zero.
4. Xn = Address or data register used as an index register; form is Xn, SIZE*SCALE, where SIZE is.W or.L (indicates index register size) and SCALE is 1, 2, 4, or 8 (index register is multiplied by SCALE); use of SIZE and/or SCALE is optional.
5. bd = A two-complement base displacement; when present, size can be 16- or 32-bit.
6. od = Outer displacement, added as part of effective address calculation after any memory indirection; use is optional with a size of 16- or 32-bit.
7. PC = Program Counter.
8. (data) = Immediate value of 8, 16 or 32 bits.
9. () = Effective Address.
10. [ ] = Use as indirect address to long word address.

Instruction Set Overview

The TS68020 instruction set is shown in Table 9. Special emphasis has been given to the instruction set's support of structured high-level languages and sophisticated operating systems. Each instruction, with few exceptions, operates on bytes, words, and long words and most instructions can use any of the 18 addressing modes. Many instruction extensions have been made on the TS68020 to take advantage of the full 32-bit operation where, on the earlier 68000 Family members, only 8 and 16 bits values were used. The TS68020 is upward source- and object-level code compatible with the family because it supports all of the instructions that previous family members offer. Additional instructions are now provided by the TS68020 in support of its advanced features.

Table 9. Instruction Set

Mnemonic	Description
ABCD	Add Decimal with Extend
ADD	Add
ADDA	Add Address
ADDI	Add Immediate
ADDQ	Add Quick
ADDX	Add with Extend
AND	Logical AND
ANDI	Logical AND Immediate
ASL, ASR	Arithmetic Shift Left and Right
Bcc	Branch Conditionally
BCHG	Test Bit and Change
BCLR	Test Bit and Clear
BFCHG	Test Bit Field and Change
BFCLR	Test Bit Field and Clear
BFEXTS	Signed Bit Field Extract
BFEXTU	Unsigned Bit Field Extract
BFFFO	Bit Field Find First One
BFINS	Bit Field Insert
BFSET	Test Bit Field and Set
BFTST	Test Bit Field
BKPT	Breakpoint
BRA	Branch
BSET	Test Bit and Set
BSR	Branch to Subroutine
BTST	Test Bit

Table 9. Instruction Set (Continued)

Mnemonic	Description
OR	Logical Inclusive OR
ORI	Logical Inclusive OR Immediate
PACK	Pack BCD
PEA	Push Effective Address
RESET	Reset External Devices
ROL, ROR	Rotate Left and Right
ROXL, ROXR	Rotate with Extend Left and Right
RTD	Return and Deallocate
RTE	Return and Exception
RTM	Return from Module
RTR	Return and Restore Codes
RTS	Return from Subroutine
SBCD	Subtract Decimal with Extend
Scc	Set Conditionally
STOP	Stop
SUB	Subtract
SUBA	Subtract Address
SUBI	Subtract Immediate
SUBQ	Subtract Quick
SUBX	Subtract with Extend
SWAP	Swap Register Words
TAS	Test Operand and Set
TRAP	Trap
TRAPcc	Trap Conditionally
TRAPV	Trap on Overflow
TST	Test Operand
UNLK	Unlink
UNPK	Unpack BCD
Co-processor Instructions	
cpBCC	Branch Conditionally
cpDBcc	Test Co-processor Condition, Decrement and Branch
cpGEN	Co-processor General Instruction
cpRESTORE	Restore Internal State of Co-processor
cpSAVE	Save Internal State of Co-processor
cpScc	Set Conditionally
cpTRAPcc	Trap Conditionally

Multi-processing

To further support multi-processing with the TS68020, a compare and swap instruction, CAS, has been added. This instruction makes use of the read-modify-write cycle to compare two operands and swap a third operand pending the results of the compare. A variant of this instruction, CAS2, performs similarly comparing dual operand pairs, and updating two operands.

These multi-processing operations are useful when using common memory to share or pass data between multiple processing elements. The read-modify-write cycle is an indivisible operand that allows reading and updating a “lock” operand used to control access to the common memory elements. The CAS2 instruction is more powerful since dual operands allow the “lock” to the checked and two values (i.e., both pointers in a doubly-linked list) to be updated according to the lock’s status, all in a single operation.

Module Support

The TS68020 includes support for modules with the call module (CALLM) and return from module (RTM) instructions. The CALLM instruction references a module descriptor. This descriptor contains control information for entry into the associated module. The CALLM instruction creates a module stack frame and stores the module state in that frame. The RTM instruction recovers the previous module state from the stack frame and returns to the calling module.

The module interface also provides a mechanism for finer resolution of access control by external hardware. Although the TS68020 does not interrupt the access control information, it does communicate with external hardware when the access control is to be changed, and relies on the external hardware to verify that the changes are legal.

CALLM and RTM, when used as subroutine calls and returns with proper descriptor formats, cause the TS68020 to perform the necessary actions to verify legitimate access to modules.

Virtual Memory/Machine Concepts

The full addressing range of the TS68020 is 4-Gbyte (4, 294, 967, 296). However, most TS68020 systems implement a smaller physical memory. Nonetheless, by using virtual memory techniques, the system can be made to appear to have a full 4-Gbyte of physical memory available to each user program. These techniques have been used for many years in large mainframe computers and minicomputers. With the TS68020 (as with the TS68010 and TS68012), virtual memory can be fully supported in microprocessor-based systems.

In a virtual memory system, a user program can be written as though it has a large amount of memory available to it when actually only a smaller amount of memory is physically present in the system. In a similar fashion, a system provides user programs access to other devices that are not physically present in the system, such as tape drives, disk drives, printers, or terminals. With proper software emulation, a physical system can be made to appear to a user program as any other 68000 computer system and the program may be given full access to all of the resources of that emulated system. Such an emulator system is called a virtual machine.

Virtual Memory

The basic mechanism for supporting virtual memory is to provides a limited amount of high-speed physical memory that can be accessed directly by the processor while maintaining of a much larger “virtual” memory on secondary storage devices such as large capacity disk drives. When the processor attempts to access a location in the virtual memory map that is not resident in the physical memory (referred to as a page fault), the access to that location is temporarily suspended while the necessary data is fetched from secondary storage and placed in physical memory; the suspended access is then either restarted or continued.
