Understanding Embedded - CPLDs (Complex Programmable Logic Devices)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

GENERAL DESCRIPTION

The ispMACH™ 4A family from Lattice offers an exceptionally flexible architecture and delivers a superior Complex Programmable Logic Device (CPLD) solution of easy-to-use silicon products and software tools. The overall benefits for users are a guaranteed and predictable CPLD solution, faster time-to-market, greater flexibility and lower cost. The ispMACH 4A devices offer densities ranging from 32 to 512 macrocells with 100% utilization and 100% pin-out retention. The ispMACH 4A families offer 5-V (M4A5-xxx) and 3.3-V (M4A3-xxx) operation.

ispMACH 4A products are 5-V or 3.3-V in-system programmable through the JTAG (IEEE Std. 1149.1) interface. JTAG boundary scan testing also allows product testability on automated test equipment for device connectivity.

All ispMACH 4A family members deliver First-Time-Fit and easy system integration with pin-out retention after any design change and refit. For both 3.3-V and 5-V operation, ispMACH 4A products can deliver guaranteed fixed timing as fast as 5.0 ns t_{PD} and 182 MHz f_{CNT} through the SpeedLocking feature when using up to 20 product terms per output (Table 2).

Macrocell-I/O Cell Ratio	2:1	1:1
Input Switch Matrix	Yes	Yes ¹
Input Registers	Yes	No
Central Switch Matrix	Yes	Yes
Output Switch Matrix	Yes	Yes

The Macrocell-I/O cell ratio is defined as the number of macrocells versus the number of I/O cells internally in a PAL block (Table 4).

The central switch matrix takes all dedicated inputs and signals from the input switch matrices and routes them as needed to the PAL blocks. Feedback signals that return to the same PAL block still must go through the central switch matrix. This mechanism ensures that PAL blocks in ispMACH 4A devices communicate with each other with consistent, predictable delays.

The central switch matrix makes a ispMACH 4A device more advanced than simply several PAL devices on a single chip. It allows the designer to think of the device not as a collection of blocks, but as a single programmable device; the software partitions the design into PAL blocks through the central switch matrix so that the designer does not have to be concerned with the internal architecture of the device.

Each PAL block consists of:

- ◆ Product-term array
- ◆ Logic allocator
- ◆ Macrocells
- ◆ Output switch matrix
- ◆ I/O cells
- ◆ Input switch matrix
- ◆ Clock generator

Macrocell

The macrocell consists of a storage element, routing resources, a clock multiplexer, and initialization control. The macrocell has two fundamental modes: synchronous and asynchronous (Figure 5). The mode chosen only affects clocking and initialization in the macrocell.

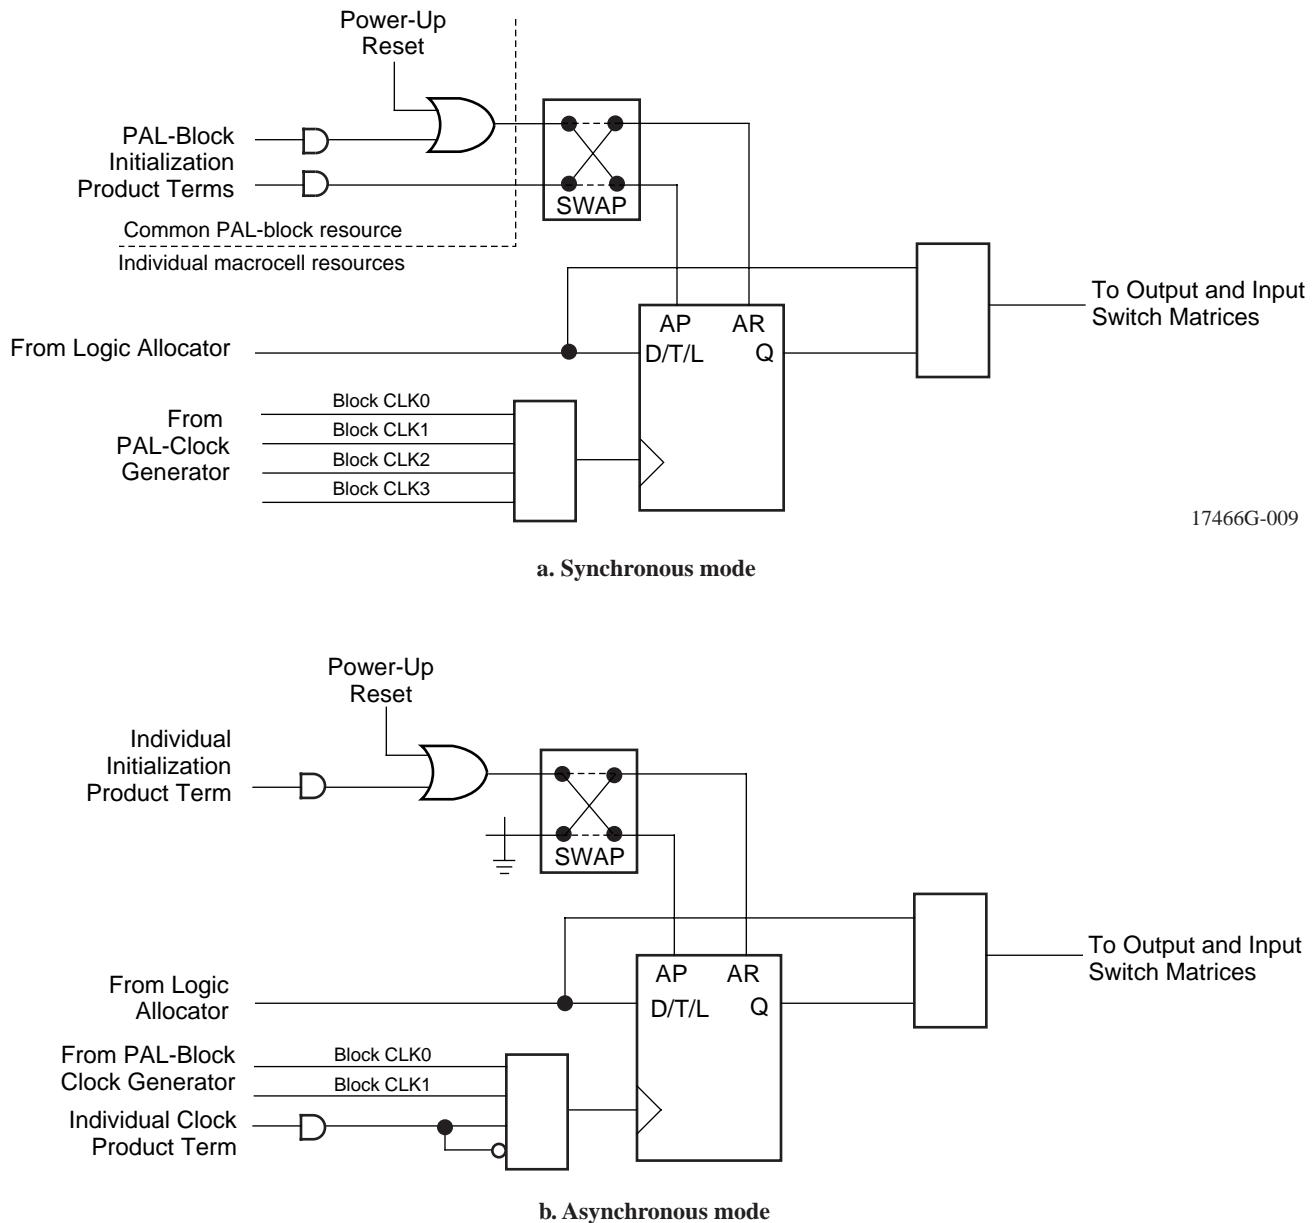

Figure 5. Macrocell

In either mode, a combinatorial path can be used. For combinatorial logic, the synchronous mode will generally be used, since it provides more product terms in the allocator.

weakly pulled up. For the circuit diagram, please refer to the document entitled *MACH Endurance Characteristics* on the Lattice Data Book CD-ROM or Lattice web site.

POWER MANAGEMENT

Each individual PAL block in ispMACH 4A devices features a programmable low-power mode, which results in power savings of up to 50%. The signal speed paths in the low-power PAL block will be slower than those in the non-low-power PAL block. This feature allows speed critical paths to run at maximum frequency while the rest of the signal paths operate in the low-power mode.

PROGRAMMABLE SLEW RATE

Each ispMACH 4A device I/O has an individually programmable output slew rate control bit. Each output can be individually configured for the higher speed transition (3 V/ns) or for the lower noise transition (1 V/ns). For high-speed designs with long, unterminated traces, the slow-slew rate will introduce fewer reflections, less noise, and keep ground bounce to a minimum. For designs with short traces or well terminated lines, the fast slew rate can be used to achieve the highest speed. The slew rate is adjusted independent of power.

POWER-UP RESET/SET

All flip-flops power up to a known state for predictable system initialization. If a macrocell is configured to SET on a signal from the control generator, then that macrocell will be SET during device power-up. If a macrocell is configured to RESET on a signal from the control generator or is not configured for set/reset, then that macrocell will RESET on power-up. To guarantee initialization values, the V_{CC} rise must be monotonic, and the clock must be inactive until the reset delay time has elapsed.

SECURITY BIT

A programmable security bit is provided on the ispMACH 4A devices as a deterrent to unauthorized copying of the array configuration patterns. Once programmed, this bit defeats readback of the programmed pattern by a device programmer, securing proprietary designs from competitors. Programming and verification are also defeated by the security bit. The bit can only be reset by erasing the entire device.

HOT SOCKETING

ispMACH 4A devices are well-suited for those applications that require hot socketing capability. Hot socketing a device requires that the device, when powered down, can tolerate active signals on the I/Os and inputs without being damaged. Additionally, it requires that the effects of the powered-down MACH devices be minimal on active signals.

ispMACH 4A PRODUCT ORDERING INFORMATION

ispMACH 4A Devices Commercial and Industrial - 3.3V and 5V

Lattice programmable logic products are available with several ordering options. The order number (Valid Combination) is formed by a combination of:

M4A3-	256 / 128	-7	Y	C	T ₄₈	= 48-pin TQFP for M4A3-32/32 or M4A3-64/32 M4A5-32/32 or M4A5-64/32
FAMILY TYPE						OPERATING CONDITIONS
M4A3- = ispMACH 4A Family Low Voltage Advanced Feature (3.3-V V _{CC})						C = Commercial (0°C to +70°C)
M4A5- = ispMACH 4A Family Advanced Feature (5-V V _{CC})						I = Industrial (-40°C to +85°C)
MACROCELL DENSITY						PACKAGE TYPE
32 = 32 Macrocells	192 = 192 Macrocells					SA = Ball Grid Array (BGA)
64 = 64 Macrocells	256 = 256 Macrocells					J = Plastic Leaded Chip Carrier (PLCC)
96 = 96 Macrocells	384 = 384 Macrocells					JN = Lead-free Plastic Leaded Chip Carrier (PLCC)
128 = 128 Macrocells	512 = 512 Macrocells					V = Thin Quad Flat Pack (TQFP)
I/Os						VN = Lead-free Thin Quad Flat Pack (TQFP)
/32 = 32 I/Os in 44-pin PLCC, 44-pin TQFP or 48-pin TQFP						Y = Plastic Quad Flat Pack (PQFP)
/48 = 48 I/Os in 100-pin TQFP						YN = Lead-free Plastic Quad Flat Pack (PQFP)
/64 = 64 I/Os in 100-pin TQFP, 100-pin PQFP, or 100-ball caBGA						FA = Fine-pitch Ball Grid Array (fpBGA)
/96 = 96 I/Os in 144-pin TQFP or 144-ball fpBGA						FAN = Lead-free Fine-pitch Ball Grid Array (fpBGA)
/128 = 128 I/Os in 208-pin PQFP, 256-ball BGA or 256-ball fpBGA						CA = Chip-array Ball Grid Array (caBGA)
/160 = 160 I/Os in 208-pin PQFP						
/192 = 192 I/Os in 256-ball BGA or 256-ball fpBGA						
/256 = 256 I/Os in 388-ball fpBGA

Most ispMACH devices are dual-marked with both Commercial and Industrial grades. The Industrial speed grade is slower, i.e., M4A3-256/128-7YC-10YI

Valid Combinations

Valid Combinations list configurations planned to be supported in volume for this device. Consult the local Lattice sales office to confirm availability of specific valid combinations and to check on newly released combinations.

Revision History

Date	Version	Change Summary
-	K	Previous Lattice release.
August 2006	L	Updated for lead-free package options.
September 2006	M	Revised M4A3-256/160 208-pin PQFP connection diagram.
