### Understanding [Embedded - CPLDs \(Complex Programmable Logic Devices\)](#)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

### Applications of Embedded - CPLDs

## GENERAL DESCRIPTION

The ispMACH™ 4A family from Lattice offers an exceptionally flexible architecture and delivers a superior Complex Programmable Logic Device (CPLD) solution of easy-to-use silicon products and software tools. The overall benefits for users are a guaranteed and predictable CPLD solution, faster time-to-market, greater flexibility and lower cost. The ispMACH 4A devices offer densities ranging from 32 to 512 macrocells with 100% utilization and 100% pin-out retention. The ispMACH 4A families offer 5-V (M4A5-xxx) and 3.3-V (M4A3-xxx) operation.

ispMACH 4A products are 5-V or 3.3-V in-system programmable through the JTAG (IEEE Std. 1149.1) interface. JTAG boundary scan testing also allows product testability on automated test equipment for device connectivity.

All ispMACH 4A family members deliver First-Time-Fit and easy system integration with pin-out retention after any design change and refit. For both 3.3-V and 5-V operation, ispMACH 4A products can deliver guaranteed fixed timing as fast as 5.0 ns  $t_{PD}$  and 182 MHz  $f_{CNT}$  through the SpeedLocking feature when using up to 20 product terms per output (Table 2).

**Note:**

1. C = Commercial, I = Industrial

## Product-Term Array

The product-term array consists of a number of product terms that form the basis of the logic being implemented. The inputs to the AND gates come from the central switch matrix (Table 5), and are provided in both true and complement forms for efficient logic implementation.

**Table 5. PAL Block Inputs**

| Device                        | Number of Inputs to PAL Block |
|-------------------------------|-------------------------------|
| M4A3-32/32 and M4A5-32/32     | 33                            |
| M4A3-64/32 and M4A5-64/32     | 33                            |
| M4A3-64/64                    | 33                            |
| M4A3-96/48 and M4A5-96/48     | 33                            |
| M4A3-128/64 and M4A5-128/64   | 33                            |
| M4A3-192/96 and M4A5-192/96   | 34                            |
| M4A3-256/128 and M4A5-256/128 | 34                            |
| M4A3-256/160 and M4A3-256/192 | 36                            |
| M4A3-384                      | 36                            |
| M4A3-512                      | 36                            |

## Logic Allocator

Within the logic allocator, product terms are allocated to macrocells in “product term clusters.” The availability and distribution of product term clusters are automatically considered by the software as it fits functions within a PAL block. The size of a product term cluster has been optimized to provide high utilization of product terms, making complex functions using many product terms possible. Yet when few product terms are used, there will be a minimal number of unused—or wasted—product terms left over. The product term clusters available to each macrocell within a PAL block are shown in Tables 6 and 7.

Each product term cluster is associated with a macrocell. The size of a cluster depends on the configuration of the associated macrocell. When the macrocell is used in synchronous mode (Figure 2a), the basic cluster has 4 product terms. When the associated macrocell is used in asynchronous mode (Figure 2b), the cluster has 2 product terms. Note that if the product term cluster is routed to a different macrocell, the allocator configuration is not determined by the mode of the macrocell actually being driven. The configuration is always set by the mode of the macrocell that the cluster will drive if not routed away, regardless of the actual routing.

In addition, there is an extra product term that can either join the basic cluster to give an extended cluster, or drive the second input of an exclusive-OR gate in the signal path. If included with the basic cluster, this provides for up to 20 product terms on a synchronous function that uses four extended 5-product-term clusters. A similar asynchronous function can have up to 18 product terms.

When the extra product term is used to extend the cluster, the value of the second XOR input can be programmed as a 0 or a 1, giving polarity control. The possible configurations of the logic allocator are shown in Figures 3 and 4.

**Table 6. Logic Allocator for All ispMACH 4A Devices (except M4A(3,5)-32/32)**

| Output Macrocell | Available Clusters                                                | Output Macrocell | Available Clusters                                                    |
|------------------|-------------------------------------------------------------------|------------------|-----------------------------------------------------------------------|

**b. Asynchronous Mode**

17466G-006

**Figure 2. Logic Allocator: Configuration of Cluster “n” Set by Mode of Macrocell “n”**

17466G-007

**Figure 3. Logic Allocator Configurations: Synchronous Mode**

17466G-008

**Figure 4. Logic Allocator Configurations: Asynchronous Mode**

Note that the configuration of the logic allocator has absolutely no impact on the speed of the signal. All configurations have the same delay. This means that designers do not have to decide between optimizing resources or speed; both can be optimized.

If not used in the cluster, the extra product term can act in conjunction with the basic cluster to provide XOR logic for such functions as data comparison, or it can work with the D-,T-type flip-flop to provide for J-K, and S-R register operation. In addition, if the basic cluster is routed to another macrocell, the extra product term is still available for logic. In this case, the first XOR input will be a logic 0. This circuit has the flexibility to route product terms elsewhere without giving up the use of the macrocell.

Product term clusters do not “wrap” around a PAL block. This means that the macrocells at the ends of the block have fewer product terms available.

A reset/preset swapping feature in each macrocell allows for reset and preset to be exchanged, providing flexibility. In asynchronous mode (Figure 8), a single individual product term is provided for initialization. It can be selected to control reset or preset.

17466G-014

17466G-015

**Figure 8. Asynchronous Mode Initialization Configurations**

Note that the reset/preset swapping selection feature effects power-up reset as well. The initialization functionality of the flip-flops is illustrated in Table 9. The macrocell sends its data to the output switch matrix and the input switch matrix. The output switch matrix can route this data to an output if so desired. The input switch matrix can send the signal back to the central switch matrix as feedback.

**Table 9. Asynchronous Reset/Preset Operation**

| AR | AP | CLK/LE <sup>1</sup> | Q+          |
|----|----|---------------------|-------------|
| 0  | 0  | X                   | See Table 8 |
| 0  | 1  | X                   | 1           |
| 1  | 0  | X                   | 0           |
| 1  | 1  | X                   | 0           |

**Note:**

- Transparent latch is unaffected by AR, AP

## Output Switch Matrix

The output switch matrix allows macrocells to be connected to any of several I/O cells within a PAL block. This provides high flexibility in determining pinout and allows design changes to occur without effecting pinout.

In ispMACH 4A devices with 2:1 Macrocell-I/O cell ratio, each PAL block has twice as many macrocells as I/O cells. The ispMACH 4A output switch matrix allows for half of the macrocells to drive I/O cells within a PAL block, in combinations according to Figure 9. Each I/O cell can choose from eight macrocells; each macrocell has a choice of four I/O cells. The ispMACH 4A devices with 1:1 Macrocell-I/O cell ratio allow each macrocell to drive one of eight I/O cells (Figure 9).

Figure 9. ispMACH 4A Output Switch Matrix

Table 10. Output Switch Matrix Combinations for ispMACH 4A Devices with 2:1 Macrocell-I/O Cell Ratio

| Macrocell | Routeable to I/O Cells |
|-----------|------------------------|
| M0, M1    | I/O0, I/O5, I/O6, I/O7 |
| M2, M3    | I/O0, I/O1, I/O6, I/O7 |
| M4, M5    | I/O0, I/O1, I/O2, I/O7 |
| M6, M7    | I/O0, I/O1, I/O2, I/O3 |
| M8, M9    | I/O1, I/O2, I/O3, I/O4 |
| M10, M11  | I/O2, I/O3, I/O4, I/O5 |

## I/O Cell

The I/O cell (Figures 10 and 11) simply consists of a programmable output enable, a feedback path, and flip-flop (except ispMACH 4A devices with 1:1 macrocell-I/O cell ratio). An individual output enable product term is provided for each I/O cell. The feedback signal drives the input switch matrix.

17466G-018

**Figure 11. I/O Cell for ispMACH 4A Devices with 1:1 Macrocell-I/O Cell Ratio**

The I/O cell (Figure 10) contains a flip-flop, which provides the capability for storing the input in a D-type register or latch. The clock can be any of the PAL block clocks. Both the direct and registered versions of the input are sent to the input switch matrix. This allows for such functions as “time-domain-multiplexed” data comparison, where the first data value is stored, and then the second data value is put on the I/O pin and compared with the previous stored value.

Note that the flip-flop used in the ispMACH 4A I/O cell is independent of the flip-flops in the macrocells. It powers up to a logic low.

### **Zero-Hold-Time Input Register**

The ispMACH 4A devices have a zero-hold-time (ZHT) fuse which controls the time delay associated with loading data into all I/O cell registers and latches. When programmed, the ZHT fuse increases the data path setup delays to input storage elements, matching equivalent delays in the clock path. When the fuse is erased, the setup time to the input storage element is minimized. This feature facilitates doing worst-case designs for which data is loaded from sources which have low (or zero) minimum output propagation delays from clock edges.

## Input Switch Matrix

The input switch matrix (Figures 12 and 13) optimizes routing of inputs to the central switch matrix. Without the input switch matrix, each input and feedback signal has only one way to enter the central switch matrix. The input switch matrix provides additional ways for these signals to enter the central switch matrix.

|                   | No feedback <sup>2</sup> , Min of 1/(t <sub>WLA</sub> + t <sub>WHA</sub> ), 1/(t <sub>SA</sub> + t <sub>HA</sub> ) or 1/(t <sub>SAT</sub> + t <sub>HA</sub> ) | 167 |     | 167 |     | 143 |     | 143  |     | 125  |     | 100  |     | 62.5 |     | 55.6 |     | MHz  |
| f <sub>MAXI</sub> | Maximum input register frequency, Min of 1/(t <sub>WIRH</sub> + t <sub>WIRL</sub> ) or 1/(t <sub>SIRS</sub> + t <sub>HIRS</sub> )                             | 167 |     | 167 |     | 143 |     | 143  |     | 125  |     | 100  |     | 83.3 |     | 83.3 |     | MHz  |

### Notes:

1. See "Switching Test Circuit" document on the Literature Download page of the Lattice web site.
2. This parameter does not apply to flip-flops in the emulated mode since the feedback path is required for emulation.

## CAPACITANCE<sup>1</sup>

| Parameter Symbol | Parameter Description | Test Conditions        |                           | Typ | Unit |
|------------------|-----------------------|------------------------|---------------------------|-----|------|
| $C_{IN}$         | Input capacitance     | $V_{IN}=2.0\text{ V}$  | 3.3 V or 5 V, 25°C, 1 MHz | 6   | pF   |
| $C_{I/O}$        | Output capacitance    | $V_{OUT}=2.0\text{ V}$ | 3.3 V or 5 V, 25°C, 1 MHz | 8   | pF   |

### Note:

1. These parameters are not 100% tested, but are calculated at initial characterization and at any time the design is modified where this parameter may be affected.

#### PIN DESIGNATIONS

CLK = Clock  
 GND = Ground  
 I = Input  
 I/O = Input/Output  
 N/C = No Connect  
 VCC = Supply Voltage  
 TDI = Test Data In  
 TCK = Test Clock  
 TMS = Test Mode Select  
 TDO = Test Data Out  
 TRST = Test Reset  
 ENABLE = Program
