
Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

2.1.2 Power Supply Voltage Specification

Table 2 provides the recommended operating conditions for the MPC8347E. Note that the values in Table 2 are the recommended and tested operating conditions. Proper device operation outside these conditions is not guaranteed.

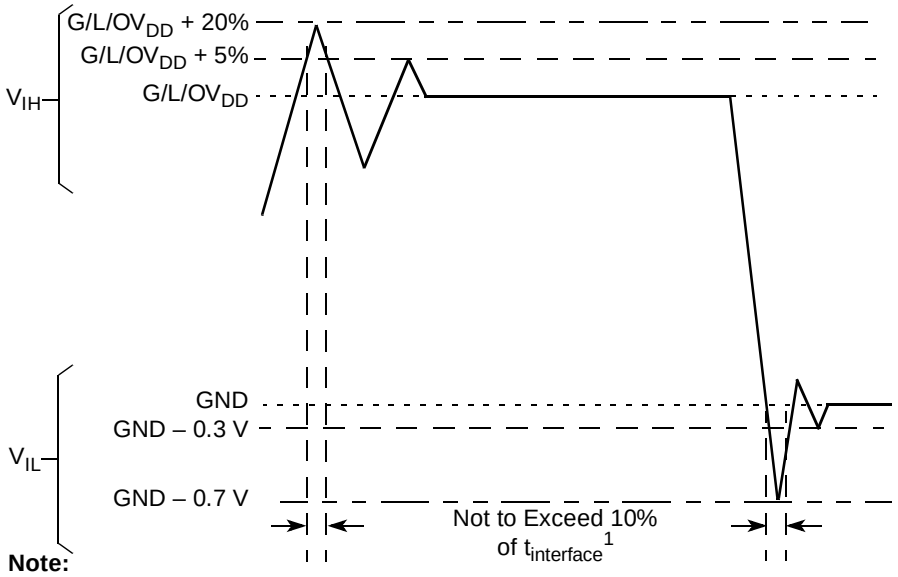
Table 2. Recommended Operating Conditions

Characteristic	Symbol	Recommended Value	Unit	Notes
Core supply voltage	V_{DD}	1.2 V ± 60 mV	V	1
PLL supply voltage	AV_{DD}	1.2 V ± 60 mV	V	1
DDR DRAM I/O supply voltage	GV_{DD}	2.5 V ± 125 mV	V	
Three-speed Ethernet I/O supply voltage	LV_{DD1}	3.3 V ± 330 mV 2.5 V ± 125 mV	V	
Three-speed Ethernet I/O supply voltage	LV_{DD2}	3.3 V ± 330 mV 2.5 V ± 125 mV	V	
PCI, local bus, DUART, system control and power management, I^2C, and JTAG I/O voltage	OV_{DD}	3.3 V ± 330 mV	V	

Note:

1 GV_{DD}, LV_{DD}, OV_{DD}, AV_{DD}, and V_{DD} must track each other and must vary in the same direction—either in the positive or negative direction.

Figure 2 shows the undershoot and overshoot voltages at the interfaces of the MPC8347E.



Note:

1. $t_{interface}$ refers to the clock period associated with the bus clock interface.

Figure 2. Overshoot/Undershoot Voltage for $GV_{DD}/OV_{DD}/LV_{DD}$

Figure 10 shows the MII transmit AC timing diagram.

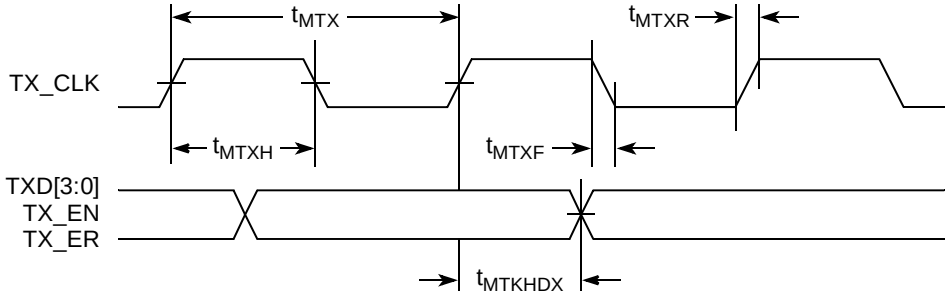


Figure 10. MII Transmit AC Timing Diagram

8.2.2.2 MII Receive AC Timing Specifications

Table 24 provides the MII receive AC timing specifications.

Table 24. MII Receive AC Timing Specifications

At recommended operating conditions with LV_{DD}/OV_{DD} of 3.3 V ± 10%.

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit
RX_CLK clock period 10 Mbps	t_{MRX}	—	400	—	ns
RX_CLK clock period 100 Mbps	t_{MRX}	—	40	—	ns
RX_CLK duty cycle	t_{MRXH}/t_{MRX}	35	—	65	%
RXD[3:0], RX_DV, RX_ER setup time to RX_CLK	t_{MRDVKH}	10.0	—	—	ns
RXD[3:0], RX_DV, RX_ER hold time to RX_CLK	t_{MRDXKH}	10.0	—	—	ns
RX_CLK clock rise V_{IL}(min) to V_{IH}(max)	t_{MRXR}	1.0	—	4.0	ns
RX_CLK clock fall time V_{IH}(max) to V_{IL}(min)	t_{MRXF}	1.0	—	4.0	ns

Note:

1. The symbols for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{MRDVKH} symbolizes MII receive timing (MR) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{MRX} clock reference (K) going to the high (H) state or setup time. Also, t_{MRDXKL} symbolizes MII receive timing (GR) with respect to the time data input signals (D) went invalid (X) relative to the t_{MRX} clock reference (K) going to the low (L) state or hold time. In general, the clock reference symbol is based on three letters representing the clock of a particular functionl. For example, the subscript of t_{MRX} represents the MII (M) receive (RX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).

Figure 11 provides the AC test load for TSEC.

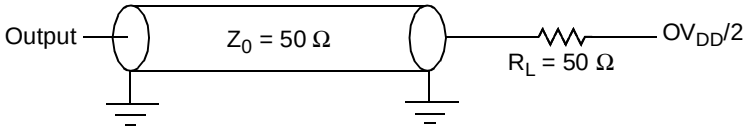

Figure 11. TSEC AC Test Load

8.3.2 MII Management AC Electrical Specifications

Table 30 provides the MII management AC timing specifications.

Table 30. MII Management AC Timing Specifications

At recommended operating conditions with LV_{DD} is 3.3 V ± 10% or 2.5 V ± 5%.

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit	Notes
MDC frequency	f_{MDC}	—	2.5	—	MHz	2
MDC period	t_{MDC}	—	400	—	ns	
MDC clock pulse width high	t_{MDCH}	32	—	—	ns	
MDC to MDIO delay	t_{MDKHDX}	10	—	170	ns	3
MDIO to MDC setup time	t_{MDDVKH}	5	—	—	ns	
MDIO to MDC hold time	t_{MDDXKH}	0	—	—	ns	
MDC rise time	t_{MDCR}	—	—	10	ns	
MDC fall time	t_{MDHF}	—	—	10	ns	

Notes:

1. The symbols for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{MDKHDX} symbolizes management data timing (MD) for the time t_{MDC} from clock reference (K) high (H) until data outputs (D) are invalid (X) or data hold time. Also, t_{MDDVKH} symbolizes management data timing (MD) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{MDC} clock reference (K) going to the high (H) state or setup time. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. This parameter is dependent on the csb_clk speed (that is, for a csb_clk of 267 MHz, the maximum frequency is 8.3 MHz and the minimum frequency is 1.2 MHz; for a csb_clk of 375 MHz, the maximum frequency is 11.7 MHz and the minimum frequency is 1.7 MHz).
3. This parameter is dependent on the csb_clk speed (that is, for a csb_clk of 267 MHz, the delay is 70 ns and for a csb_clk of 333 MHz, the delay is 58 ns).

Figure 16 shows the MII management AC timing diagram.

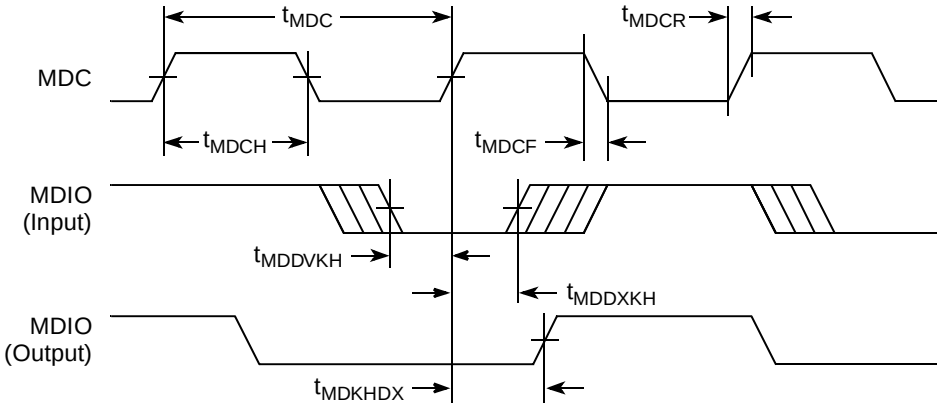

Figure 16. MII Management Interface Timing Diagram

10 Local Bus

This section describes the DC and AC electrical specifications for the local bus interface of the MPC8347E.

10.1 Local Bus DC Electrical Characteristics

Table 33 provides the DC electrical characteristics for the local bus interface.

Table 33. Local Bus DC Electrical Characteristics

Parameter	Symbol	Min	Max	Unit
High-level input voltage	V_{IH}	2	OV_{DD} + 0.3	V
Low-level input voltage	V_{IL}	–0.3	0.8	V
Input current	I_{IN}	—	±5	μA
High-level output voltage, I_{OH} = –100 μA	V_{OH}	OV_{DD} – 0.2	—	V
Low-level output voltage, I_{OL} = 100 μA	V_{OL}	—	0.2	V

10.2 Local Bus AC Electrical Specification

Table 34 and Table 35 describe the general timing parameters of the local bus interface of the MPC8347E.

Table 34. Local Bus General Timing Parameters—DLL On

Parameter	Symbol[1]	Min	Max	Unit	Notes
Local bus cycle time	t_{LBK}	7.5	—	ns	2
Input setup to local bus clock (except LUPWAIT)	$t_{LBIVKH1}$	1.5	—	ns	3, 4
LUPWAIT input setup to local bus clock	$t_{LBIVKH2}$	2.2	—	ns	3, 4
Input hold from local bus clock (except LUPWAIT)	$t_{LBIXKH1}$	1.0	—	ns	3, 4
LUPWAIT Input hold from local bus clock	$t_{LBIXKH2}$	1.0	—	ns	3, 4
LALE output fall to LAD output transition (LATCH hold time)	$t_{LBOTOT1}$	1.5	—	ns	5
LALE output fall to LAD output transition (LATCH hold time)	$t_{LBOTOT2}$	3	—	ns	6
LALE output fall to LAD output transition (LATCH hold time)	$t_{LBOTOT3}$	2.5	—	ns	7
Local bus clock to LALE rise	t_{LBKHLR}	—	4.5	ns	
Local bus clock to output valid (except LAD/LDP and LALE)	$t_{LBKHOV1}$	—	4.5	ns	
Local bus clock to data valid for LAD/LDP	$t_{LBKHOV2}$	—	4.5	ns	3
Local bus clock to address valid for LAD	$t_{LBKHOV3}$	—	4.5	ns	3
Output hold from local bus clock (except LAD/LDP and LALE)	$t_{LBKHOX1}$	1	—	ns	3

Table 37. JTAG AC Timing Specifications (Independent of CLKIN)[1] (continued)

At recommended operating conditions (see Table 2).

Parameter	Symbol[2]	Min	Max	Unit	Notes
Output hold times: Boundary-scan data TDO	 t_{JTKLDX} t_{JTKLOX}	 2 2	 — —	ns	5
JTAG external clock to output high impedance: Boundary-scan data TDO	 t_{JTKLDZ} t_{JTKLOZ}	 2 2	 19 9	ns	5, 6

Notes:

1. All outputs are measured from the midpoint voltage of the falling/rising edge of t_{TCLK} to the midpoint of the signal in question. The output timings are measured at the pins. All output timings assume a purely resistive 50 Ω load (see Figure 26). Time-of-flight delays must be added for trace lengths, vias, and connectors in the system.
2. The symbols for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{JTDVKH} symbolizes JTAG device timing (JT) with respect to the time data input signals (D) reaching the valid state (V) relative to the t_{JTG} clock reference (K) going to the high (H) state or setup time. Also, t_{JTDXKH} symbolizes JTAG timing (JT) with respect to the time data input signals (D) went invalid (X) relative to the t_{JTG} clock reference (K) going to the high (H) state. In general, the clock reference symbol is based on three letters representing the clock of a particular function. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
3. $\overline{\text{TRST}}$ is an asynchronous level sensitive signal. The setup time is for test purposes only.
4. Non-JTAG signal input timing with respect to t_{TCLK}.
5. Non-JTAG signal output timing with respect to t_{TCLK}.
6. Guaranteed by design and characterization.

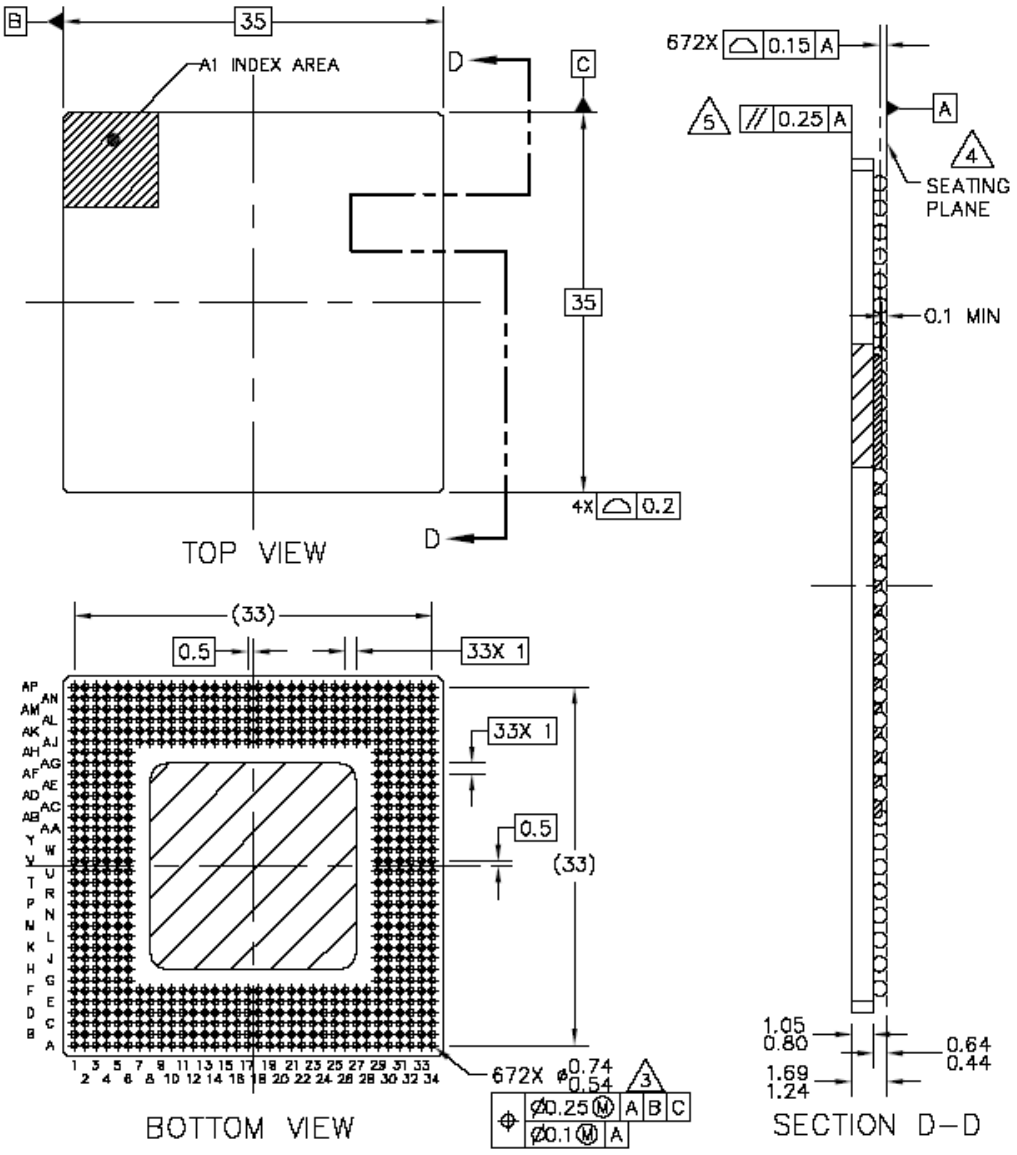
18.2 Mechanical Dimensions for the MPC8347E TBGA

Figure 39 shows the mechanical dimensions and bottom surface nomenclature for the MPC8347E, 672-TBGA package.



Notes:

1.All dimensions are in millimeters.

2.Dimensions and tolerances per ASME Y14.5M-1994.

3.Maximum solder ball diameter measured parallel to datum A.

4.Datum A, the seating plane, is determined by the spherical crowns of the solder balls.

5.Parallelism measurement must exclude any effect of mark on top surface of package.

Figure 39. Mechanical Dimensions and Bottom Surface Nomenclature for the MPC8347E TBGA

19 Clocking

Figure 41 shows the internal distribution of the clocks.

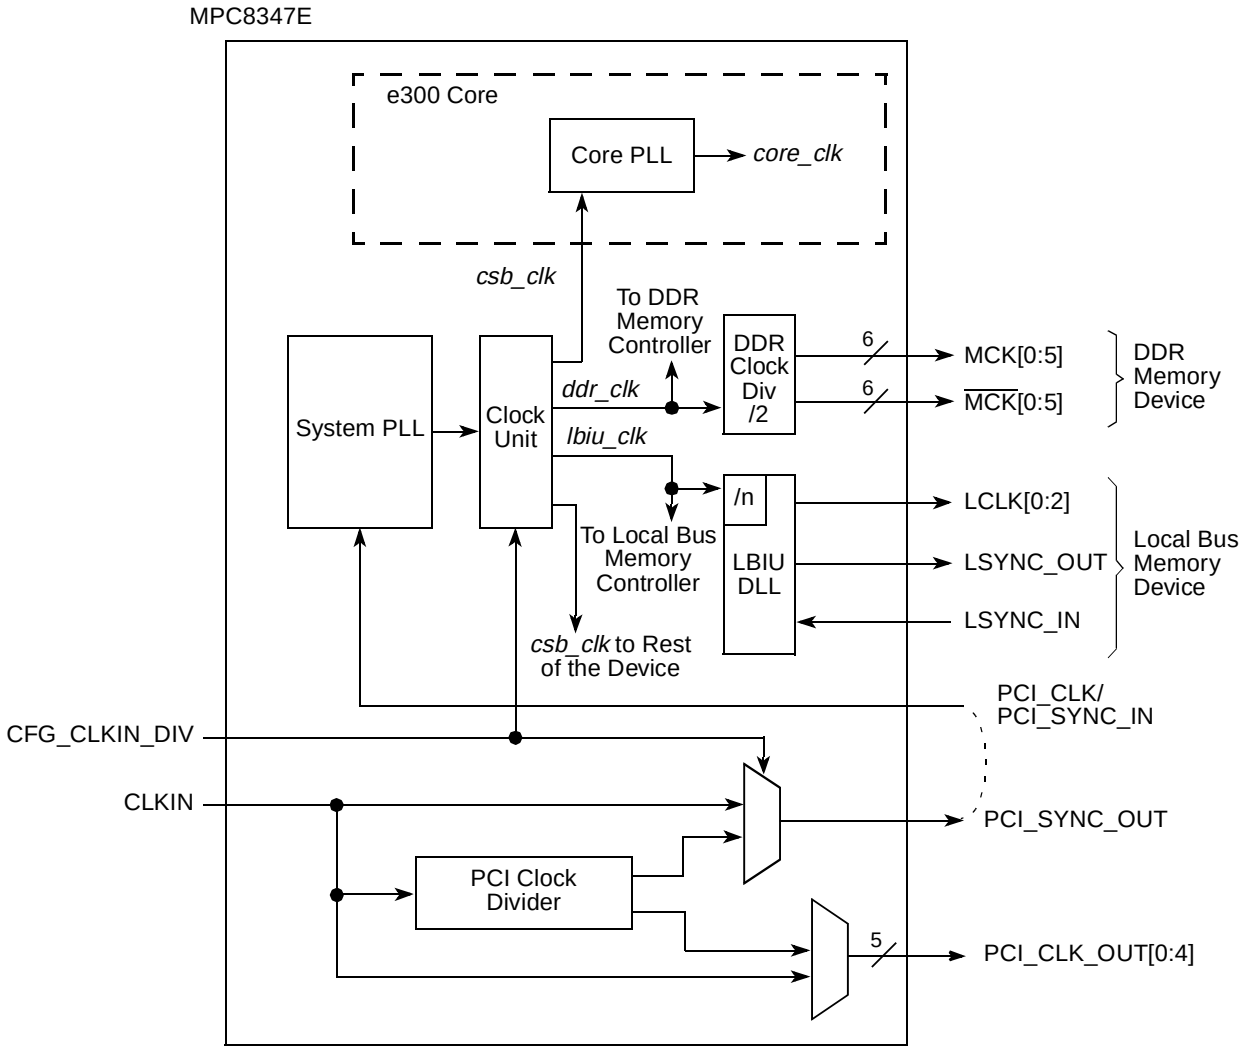

Figure 41. MPC8347E Clock Subsystem

The primary clock source can be one of two inputs, CLKIN or PCI_CLK, depending on whether the device is configured in PCI host or PCI agent mode. When the MPC8347E is configured as a PCI host device, CLKIN is its primary input clock. CLKIN feeds the PCI clock divider (÷2) and the multiplexors for PCI_SYNC_OUT and PCI_CLK_OUT. The CFG_CLKIN_DIV configuration input selects whether CLKIN or CLKIN/2 is driven out on the PCI_SYNC_OUT signal. The OCCR[PCICD*n*] parameters select whether CLKIN or CLKIN/2 is driven out on the PCI_CLK_OUT*n* signals.

PCI_SYNC_OUT is connected externally to PCI_SYNC_IN to allow the internal clock subsystem to synchronize to the system PCI clocks. PCI_SYNC_OUT must be connected properly to PCI_SYNC_IN, with equal delay to all PCI agent devices in the system, to allow the MPC8347E to function. When the MPC8347E is configured as a PCI agent device, PCI_CLK is the primary input clock and the CLKIN signal should be tied to GND.

19.1 System PLL Configuration

The system PLL is controlled by the RCWL[SPMF] parameter. Table 56 shows the multiplication factor encodings for the system PLL.

Table 56. System PLL Multiplication Factors

RCWL[SPMF]	System PLL Multiplication Factor
0000	× 16
0001	Reserved
0010	× 2
0011	× 3
0100	× 4
0101	× 5
0110	× 6
0111	× 7
1000	× 8
1001	× 9
1010	× 10
1011	× 11
1100	× 12
1101	× 13
1110	× 14
1111	× 15

As described in Section 19, “Clocking,” the LBIUCM, DDRCM, and SPMF parameters in the reset configuration word low and the CFG_CLKIN_DIV configuration input signal select the ratio between the primary clock input (CLKIN or PCI_CLK) and the internal coherent system bus clock (*csb_clk*). Table 57 and Table 58 show the expected frequency values for the CSB frequency for select *csb_clk* to CLKIN/PCI_SYNC_IN ratios.

Table 60. Suggested PLL Configurations

1 The PLL configuration reference number is the hexadecimal representation of RCWL, bits 4–15 associated with the SPMF and COREPLL settings given in the table.

2 The input clock is CLKIN for PCI host mode or PCI_CLK for PCI agent mode.

where:

$R_{\theta JA}$ = junction-to-ambient thermal resistance (°C/W)

$R_{\theta JC}$ = junction-to-case thermal resistance (°C/W)

$R_{\theta CA}$ = case-to-ambient thermal resistance (°C/W)

$R_{\theta JC}$ is device-related and cannot be influenced by the user. The user controls the thermal environment to change the case-to-ambient thermal resistance, $R_{\theta CA}$. For instance, the user can change the size of the heat sink, the air flow around the device, the interface material, the mounting arrangement on printed-circuit board, or change the thermal dissipation on the printed-circuit board surrounding the device.

The thermal performance of devices with heat sinks has been simulated with a few commercially available heat sinks. The heat sink choice is determined by the application environment (temperature, air flow, adjacent component power dissipation) and the physical space available. Because there is not a standard application environment, a standard heat sink is not required.

Table 63 and Table 64 show heat sink thermal resistance for TBGA and PBGA of the MPC8347E.

Table 63. Heat Sink and Thermal Resistance of MPC8347E (TBGA)

Heat Sink Assuming Thermal Grease	Air Flow	35 × 35 mm TBGA
		Thermal Resistance
AAVID 30 × 30 × 9.4 mm pin fin	Natural convection	10
AAVID 30 × 30 × 9.4 mm pin fin	1 m/s	6.5
AAVID 30 × 30 × 9.4 mm pin fin	2 m/s	5.6
AAVID 31 × 35 × 23 mm pin fin	Natural convection	8.4
AAVID 31 × 35 × 23 mm pin fin	1 m/s	4.7
AAVID 31 × 35 × 23 mm pin fin	2 m/s	4
Wakefield, 53 × 53 × 25 mm pin fin	Natural convection	5.7
Wakefield, 53 × 53 × 25 mm pin fin	1 m/s	3.5
Wakefield, 53 × 53 × 25 mm pin fin	2 m/s	2.7
MEI, 75 × 85 × 12 no adjacent board, extrusion	Natural convection	6.7
MEI, 75 × 85 × 12 no adjacent board, extrusion	1 m/s	4.1
MEI, 75 × 85 × 12 no adjacent board, extrusion	2 m/s	2.8
MEI, 75 × 85 × 12 mm, adjacent board, 40 mm side bypass	1 m/s	3.1

Table 64. Heat Sink and Thermal Resistance of MPC8347E (PBGA)

Heat Sink Assuming Thermal Grease	Air Flow	29 × 29 mm PBGA
		Thermal Resistance
AAVID 30 × 30 × 9.4 mm pin fin	Natural convection	13.5
AAVID 30 × 30 × 9.4 mm pin fin	1 m/s	9.6

Table 64. Heat Sink and Thermal Resistance of MPC8347E (PBGA) (continued)

Heat Sink Assuming Thermal Grease	Air Flow	29 × 29 mm PBGA
		Thermal Resistance
AAVID 30 × 30 × 9.4 mm pin fin	2 m/s	8.8
AAVID 31 × 35 × 23 mm pin fin	Natural convection	11.3
AAVID 31 × 35 × 23 mm pin fin	1 m/s	8.1
AAVID 31 × 35 × 23 mm pin fin	2 m/s	7.5
Wakefield, 53 × 53 × 25 mm pin fin	Natural convection	9.1
Wakefield, 53 × 53 × 25 mm pin fin	1 m/s	7.1
Wakefield, 53 × 53 × 25 mm pin fin	2 m/s	6.5
MEI, 75 × 85 × 12 no adjacent board, extrusion	Natural convection	10.1
MEI, 75 × 85 × 12 no adjacent board, extrusion	1 m/s	7.7
MEI, 75 × 85 × 12 no adjacent board, extrusion	2 m/s	6.6
MEI, 75 × 85 × 12 mm, adjacent board, 40 mm side bypass	1 m/s	6.9

Accurate thermal design requires thermal modeling of the application environment using computational fluid dynamics software which can model both the conduction cooling and the convection cooling of the air moving through the application. Simplified thermal models of the packages can be assembled using the junction-to-case and junction-to-board thermal resistances listed in the thermal resistance table. More detailed thermal models can be made available on request.

required in the heat sink. Minimize the size of the clearance to minimize the change in thermal performance caused by removing part of the thermal interface to the heat sink. Because of the experimental difficulties with this technique, many engineers measure the heat sink temperature and then back calculate the case temperature using a separate measurement of the thermal resistance of the interface. From this case temperature, the junction temperature is determined from the junction-to-case thermal resistance.

$$T_J = T_C + (R_{\theta JC} \times P_D)$$

where:

T_J = junction temperature (°C)

T_C = case temperature of the package (°C)

$R_{\theta JC}$ = junction-to-case thermal resistance (°C/W)

P_D = power dissipation (W)

the large value of the pull-up/pull-down resistor should minimize the disruption of signal quality or speed for the output pins.

21.7 Pull-Up Resistor Requirements

The MPC8347E requires high resistance pull-up resistors (10 kΩ is recommended) on open-drain pins, including I^2C pins, the Ethernet Management MDIO pin, and IPIC interrupt pins.

For more information on required pull-up resistors and the connections required for the JTAG interface, refer to application note AN2931, *PowerQUICC™ Design Checklist*.

22 Document Revision History

Table 66 provides a revision history of this document.

Table 66. Document Revision History

Revision	Date	Substantive Change(s)
11	2/2009	In Section 21.1, "System Clocking," removed "(AVDD1)" and "(AVDD2") from bulleted list. In Section 21.2, "PLL Power Supply Filtering," in the second paragraph, changed "provide five independent filter circuits," and "the five AVDD pins" to provide four independent filter circuits," and "the four AVDD pins." In Table 35, removed row for rise time (t_{I2CR}). Removed minimum value of t_{I2CF}. Added note 5 stating that the device does not follow the I2C-BUS Specifications version 2.1 regarding the t_{I2CF} AC parameter. In Table 54, corrected the max csb_clk to 266 MHz. In Table 60, added PLL configurations 903, 923, A03, A23, and 503 for 533 MHz In Table 35, corrected t_{LBKHOV} parametr to t_{LBKLOV} (output data is driven on falling edge of clock in DLL bypass mode). Similarly, made the same correction to Figure 21, Figure 23, and Figure 24 for output signals. Added Figure 1 and Figure 4. In Table 9.2, clarified that AC table is for ULPI only. Added footnote 4 to Table 67. In Table 67, updated note 1 to say the following: "For temperature range = C, processor frequency is up to 667(TBGA) with a platform frequency of 333 and limited to 400 (PBGA) with a platform frequency of 266." Added footnote 10 and 11 to Table 51 and Table 52. In Table 51, Table 52, updated note 11 to say the following: "SEC1_TXD[3] is required an external pull-up resistor. For proper functionality of the device, this pin must be pulled up or actively driven high during a hard reset. No external pull-down resistors are allowed to be attached to this net." Added footnote 6 to Table 7. In Table 7, updated the note 6 to say the following: "The Spread spectrum clocking. Is allowed with 1% input frequency down-spread at maximum 50KHz modulation rate regardless of input frequency." In 8.1.1, removed the note "The potential applied to the input of a GMII, MII, TBI, RGMII, or RTBI receiver may exceed the potential of the receiver power supply (that is, a RGMII driver powered from a 3.6 V supply driving VOH into a RGMII receiver powered from a 2.5-V supply). Tolerance for dissimilar RGMII driver and receiver supply potentials is implicit in these specifications."
10	4/2007	In Table 3, "Output Drive Capability," changed the values in the Output Impedance column and added USB to the seventh row. In Table 54, "Operating Frequencies for TBGA," added column for 400 MHz. In Section 21.7, "Pull-Up Resistor Requirements," deleted last two paragraphs and after first paragraph, added a new paragraph. Deleted Section 21.8, "JTAG Configuration Signals," and Figure 43, "JTAG Interface Connection."
9	3/2007	In Table 54, "Operating Frequencies for TBGA," in the 'Coherent system bus frequency (*csb_clk*)' row, changed the value in the 533 MHz column to 100–333. In Table 60, "Suggested PLL Configurations," under the subhead, '33 MHz CLKIN/PCI_CLK Options,' added row A03 between Ref. No. 724 and 804. Under the subhead '66 MHz CLKIN/PCI_CLK Options,' added row 503 between Ref. No. 305 and 404. For Ref. No. 306, changed the CORE PLL value to 0000110. In Section 23, "Ordering Information," replaced first paragraph and added a note. In Section 23.1, "Part Numbers Fully Addressed by This Document," replaced first paragraph.
