
Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Active
Core Processor	PowerPC e300
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	533MHz
Co-Processors/DSP	-
RAM Controllers	DDR
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100/1000Mbps (2)
SATA	-
USB	USB 2.0 + PHY (2)
Voltage - I/O	2.5V, 3.3V
Operating Temperature	0°C ~ 105°C (TA)
Security Features	-
Package / Case	672-LBGA
Supplier Device Package	672-TBGA (35x35)
Purchase URL	https://www.e-xfl.com/pro/item?MUrl=&PartUrl=mpc8347zuajfb

  - Enhanced host controller interface (EHCI) compatible
  - Complies with *USB Specification Rev. 2.0*
- High-speed (480 Mbps), full-speed (12 Mbps), and low-speed (1.5 Mbps) operations
- Direct connection to a high-speed device without an external hub
- External PHY with serial and low-pin count (ULPI) interfaces

- Local bus controller (LBC)
  - Multiplexed 32-bit address and data operating at up to 133 MHz
  - Four chip selects support four external slaves
  - Up to eight-beat burst transfers
  - 32-, 16-, and 8-bit port sizes controlled by an on-chip memory controller
  - Three protocol engines on a per chip select basis:
    - General-purpose chip select machine (GPCM)
    - Three user-programmable machines (UPMs)
    - Dedicated single data rate SDRAM controller
  - Parity support
  - Default boot ROM chip select with configurable bus width (8-, 16-, or 32-bit)
- Programmable interrupt controller (PIC)
  - Functional and programming compatibility with the MPC8260 interrupt controller
  - Support for 8 external and 35 internal discrete interrupt sources
  - Support for 1 external (optional) and 7 internal machine checkstop interrupt sources
  - Programmable highest priority request
  - Four groups of interrupts with programmable priority
  - External and internal interrupts directed to host processor
  - Redirects interrupts to external $\overline{\text{INTA}}$ pin in core disable mode.
  - Unique vector number for each interrupt source
- Dual industry-standard I^2C interfaces
  - Two-wire interface
  - Multiple master support
  - Master or slave I^2C mode support
  - On-chip digital filtering rejects spikes on the bus
  - System initialization data optionally loaded from I^2C-1 EPROM by boot sequencer embedded hardware
- DMA controller
  - Four independent virtual channels
  - Concurrent execution across multiple channels with programmable bandwidth control
  - All channels accessible to local core and remote PCI masters
  - Misaligned transfer capability

Figure 3 shows the undershoot and overshoot voltage of the PCI interface of the MPC8347E for the 3.3-V signals, respectively.

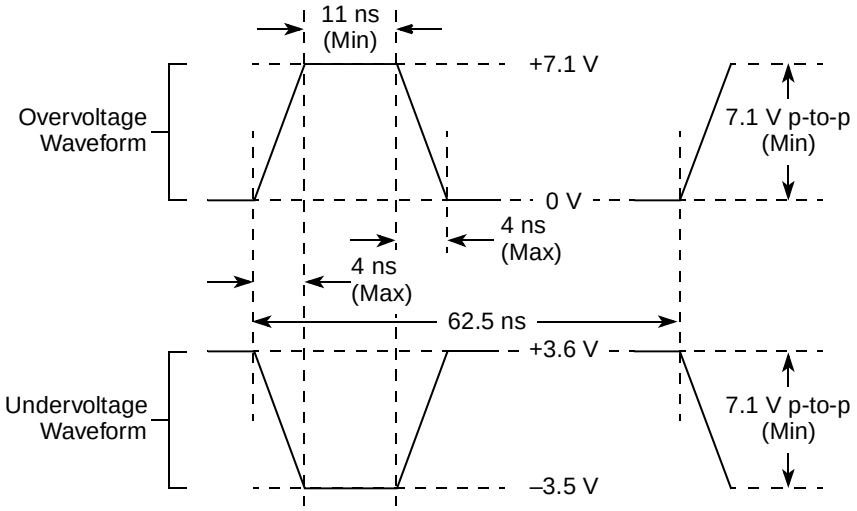

Figure 3. Maximum AC Waveforms on PCI Interface for 3.3-V Signaling

2.1.3 Output Driver Characteristics

Table 3 provides information on the characteristics of the output driver strengths. The values are preliminary estimates.

Table 3. Output Drive Capability

Driver Type	Output Impedance (Ω)	Supply Voltage
Local bus interface utilities signals	40	OV_{DD} = 3.3 V
PCI signals (not including PCI output clocks)	25	
PCI output clocks (including PCI_SYNC_OUT)	40	
DDR signal	18	GV_{DD} = 2.5 V
TSEC/10/100 signals	40	LV_{DD} = 2.5/3.3 V
DUART, system control, I^2C, JTAG, USB	40	OV_{DD} = 3.3 V
GPIO signals	40	OV_{DD} = 3.3 V, LV_{DD} = 2.5/3.3 V

2.2 Power Sequencing

MPC8347E does not require the core supply voltage and I/O supply voltages to be applied in any particular order. Note that during the power ramp up, before the power supplies are stable, there may be a period of time that I/O pins are actively driven. After the power is stable, as long as $\overline{\text{PORESET}}$ is asserted, most I/O pins are three-stated. To minimize the time that I/O pins are actively driven, it is recommended to apply core voltage before I/O voltage and assert $\overline{\text{PORESET}}$ before the power supplies fully ramp up.

8 Ethernet: Three-Speed Ethernet, MII Management

This section provides the AC and DC electrical characteristics for three-speeds (10/100/1000 Mbps) and MII management.

8.1 Three-Speed Ethernet Controller (TSEC)— GMII/MII/TBI/RGMII/RTBI Electrical Characteristics

The electrical characteristics specified here apply to the gigabit media independent interface (GMII), the media independent interface (MII), ten-bit interface (TBI), reduced gigabit media independent interface (RGMII), and reduced ten-bit interface (RTBI) signals except management data input/output (MDIO) and management data clock (MDC). The MII, GMII, and TBI interfaces are defined for 3.3 V, and the RGMII and RTBI interfaces are defined for 2.5 V. The RGMII and RTBI interfaces follow the Hewlett-Packard *Reduced Pin-Count Interface for Gigabit Ethernet Physical Layer Device Specification*, Version 1.2a (9/22/2000). The electrical characteristics for MDIO and MDC are specified in Section 8.3, "Ethernet Management Interface Electrical Characteristics."

8.1.1 TSEC DC Electrical Characteristics

GMII, MII, TBI, RGMII, and RTBI drivers and receivers comply with the DC parametric attributes specified in Table 19 and Table 20. The RGMII and RTBI signals in Table 20 are based on a 2.5-V CMOS interface voltage as defined by JEDEC EIA/JESD8-5.

Table 19. GMII/TBI and MII DC Electrical Characteristics

Parameter	Symbol	Conditions		Min	Max	Unit
Supply voltage 3.3 V	LV_{DD}[2]	—		2.97	3.63	V
Output high voltage	V_{OH}	I_{OH} = –4.0 mA	LV_{DD} = Min	2.40	LV_{DD} + 0.3	V
Output low voltage	V_{OL}	I_{OL} = 4.0 mA	LV_{DD} = Min	GND	0.50	V
Input high voltage	V_{IH}	—	—	2.0	LV_{DD} + 0.3	V
Input low voltage	V_{IL}	—	—	–0.3	0.90	V
Input high current	I_{IH}	V_{IN}[1] = LV_{DD}		—	40	µA
Input low current	I_{IL}	V_{IN}[1] = GND		–600	—	µA

Notes:
1. The symbol V_{IN}, in this case, represents the LV_{IN} symbol referenced in Table 1 and Table 2.
2. GMII/MII pins not needed for RGMII or RTBI operation are powered by the OV_{DD} supply.

Figure 10 shows the MII transmit AC timing diagram.

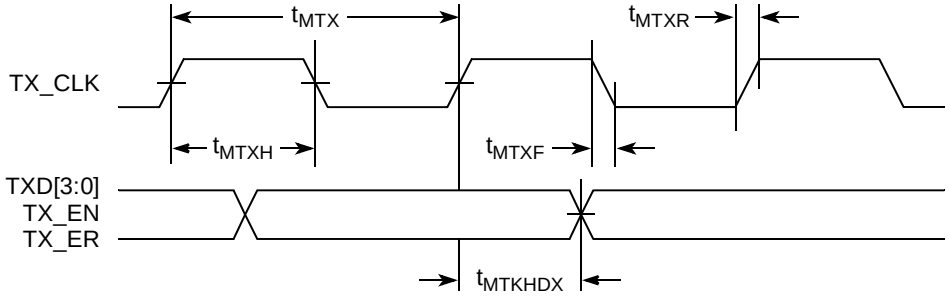

Figure 10. MII Transmit AC Timing Diagram

8.2.2.2 MII Receive AC Timing Specifications

Table 24 provides the MII receive AC timing specifications.

Table 24. MII Receive AC Timing Specifications

At recommended operating conditions with LV_{DD}/OV_{DD} of 3.3 V ± 10%.

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit
RX_CLK clock period 10 Mbps	t_{MRX}	—	400	—	ns
RX_CLK clock period 100 Mbps	t_{MRX}	—	40	—	ns
RX_CLK duty cycle	t_{MRXH}/t_{MRX}	35	—	65	%
RXD[3:0], RX_DV, RX_ER setup time to RX_CLK	t_{MRDVKH}	10.0	—	—	ns
RXD[3:0], RX_DV, RX_ER hold time to RX_CLK	t_{MRDXKH}	10.0	—	—	ns
RX_CLK clock rise V_{IL}(min) to V_{IH}(max)	t_{MRXR}	1.0	—	4.0	ns
RX_CLK clock fall time V_{IH}(max) to V_{IL}(min)	t_{MRXF}	1.0	—	4.0	ns

Note:

1. The symbols for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{MRDVKH} symbolizes MII receive timing (MR) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{MRX} clock reference (K) going to the high (H) state or setup time. Also, t_{MRDXKL} symbolizes MII receive timing (GR) with respect to the time data input signals (D) went invalid (X) relative to the t_{MRX} clock reference (K) going to the low (L) state or hold time. In general, the clock reference symbol is based on three letters representing the clock of a particular functionl. For example, the subscript of t_{MRX} represents the MII (M) receive (RX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).

Figure 11 provides the AC test load for TSEC.

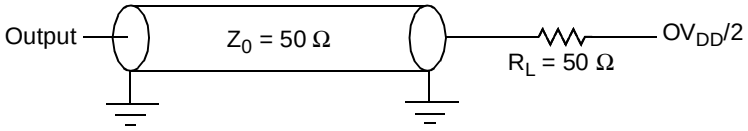

Figure 11. TSEC AC Test Load

8.3.2 MII Management AC Electrical Specifications

Table 30 provides the MII management AC timing specifications.

Table 30. MII Management AC Timing Specifications

At recommended operating conditions with LV_{DD} is 3.3 V ± 10% or 2.5 V ± 5%.

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit	Notes
MDC frequency	f_{MDC}	—	2.5	—	MHz	2
MDC period	t_{MDC}	—	400	—	ns	
MDC clock pulse width high	t_{MDCH}	32	—	—	ns	
MDC to MDIO delay	t_{MDKHDX}	10	—	170	ns	3
MDIO to MDC setup time	t_{MDDVKH}	5	—	—	ns	
MDIO to MDC hold time	t_{MDDXKH}	0	—	—	ns	
MDC rise time	t_{MDCR}	—	—	10	ns	
MDC fall time	t_{MDHF}	—	—	10	ns	

Notes:

1. The symbols for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{MDKHDX} symbolizes management data timing (MD) for the time t_{MDC} from clock reference (K) high (H) until data outputs (D) are invalid (X) or data hold time. Also, t_{MDDVKH} symbolizes management data timing (MD) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{MDC} clock reference (K) going to the high (H) state or setup time. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. This parameter is dependent on the csb_clk speed (that is, for a csb_clk of 267 MHz, the maximum frequency is 8.3 MHz and the minimum frequency is 1.2 MHz; for a csb_clk of 375 MHz, the maximum frequency is 11.7 MHz and the minimum frequency is 1.7 MHz).
3. This parameter is dependent on the csb_clk speed (that is, for a csb_clk of 267 MHz, the delay is 70 ns and for a csb_clk of 333 MHz, the delay is 58 ns).

Figure 16 shows the MII management AC timing diagram.

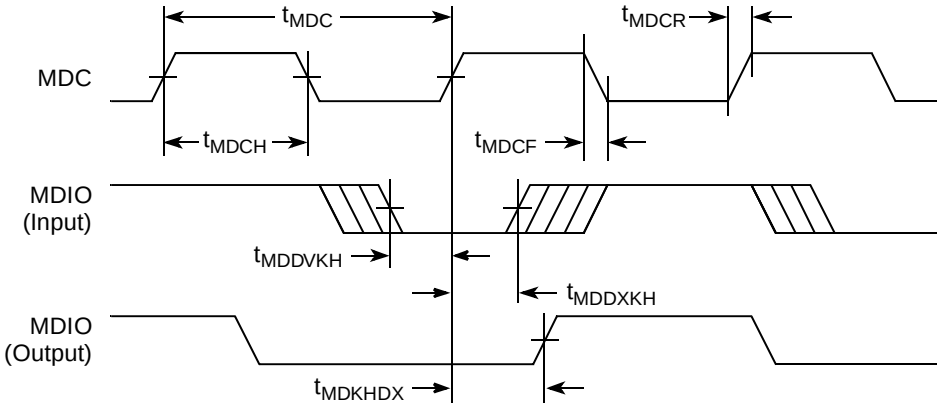

Figure 16. MII Management Interface Timing Diagram

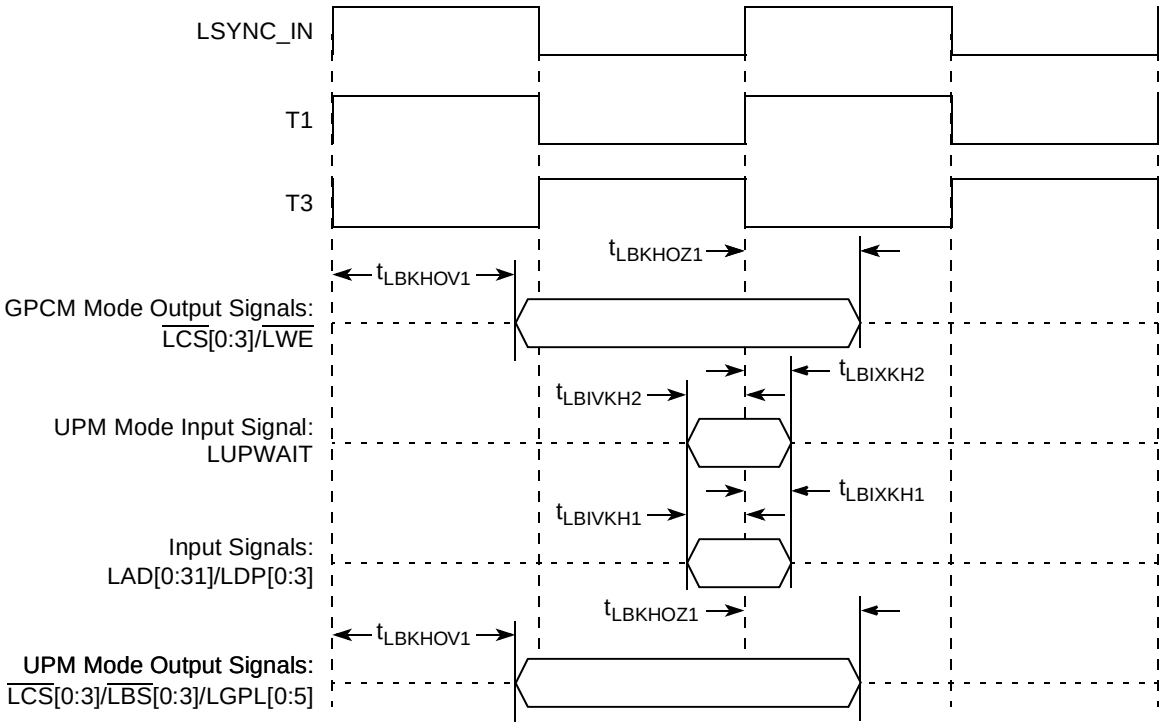

Figure 22. Local Bus Signals, GPCM/UPM Signals for LCCR[CLKDIV] = 2 (DLL Enabled)

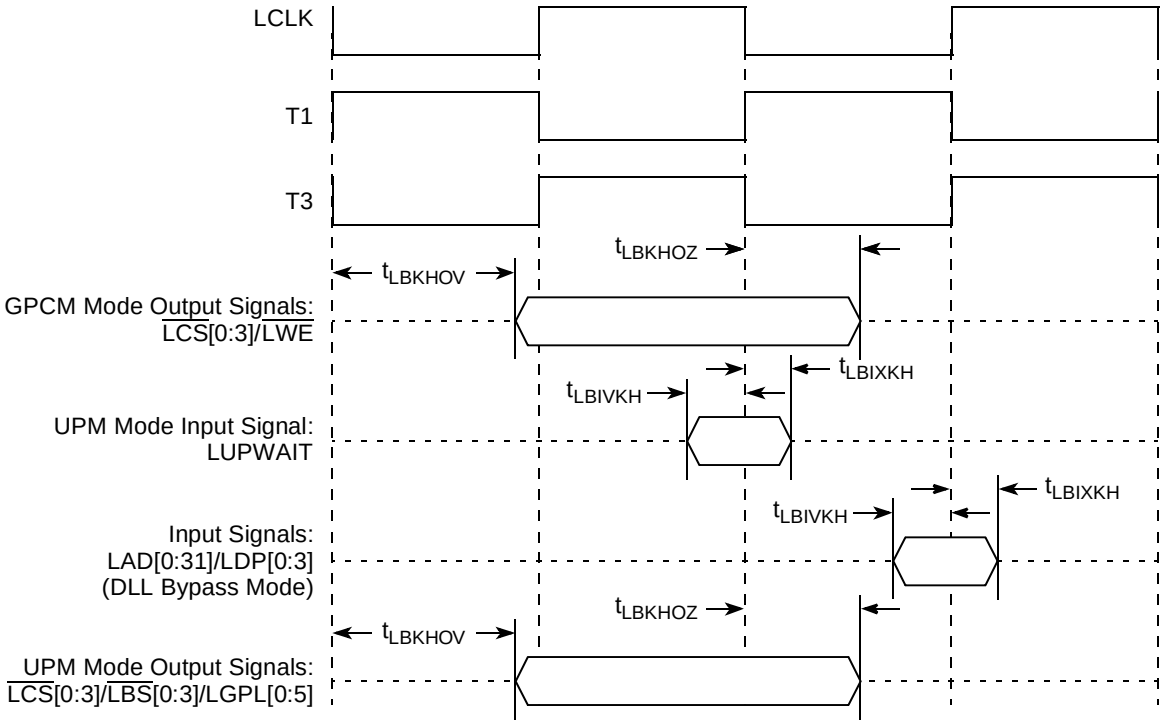

Figure 23. Local Bus Signals, GPCM/UPM Signals for LCCR[CLKDIV] = 2 (DLL Bypass Mode)

Table 39. I²C AC Electrical Specifications (continued)

Parameter	Symbol[1]	Min	Max	Unit
Fall time of both SDA and SCL signals[5]	t_{I2CF}	—	300	ns
Setup time for STOP condition	t_{I2PVKH}	0.6	—	µs
Bus free time between a STOP and START condition	t_{I2KHDX}	1.3	—	µs
Noise margin at the LOW level for each connected device (including hysteresis)	V_{NL}	$0.1 \times OV_{DD}$	—	V
Noise margin at the HIGH level for each connected device (including hysteresis)	V_{NH}	$0.2 \times OV_{DD}$	—	V

Notes:

1. The symbols for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{I2DVKH} symbolizes I²C timing (I2) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{I2C} clock reference (K) going to the high (H) state or setup time. Also, t_{I2SXKL} symbolizes I²C timing (I2) for the time that the data with respect to the start condition (S) goes invalid (X) relative to the t_{I2C} clock reference (K) going to the low (L) state or hold time. Also, t_{I2PVKH} symbolizes I²C timing (I2) for the time that the data with respect to the stop condition (P) reaches the valid state (V) relative to the t_{I2C} clock reference (K) going to the high (H) state or setup time. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. MPC8347E provides a hold time of at least 300 ns for the SDA signal (referred to the V_{IH}(min) of the SCL signal) to bridge the undefined region of the falling edge of SCL.
3. The maximum t_{I2DVKH} must be met only if the device does not stretch the LOW period (t_{I2CL}) of the SCL signal.
4. C_B = capacitance of one bus line in pF.
5. The MPC8347E does not follow the "I2C-BUS Specifications" version 2.1 regarding the t_{I2CF} AC parameter.

Figure 31 provides the AC test load for the I²C.

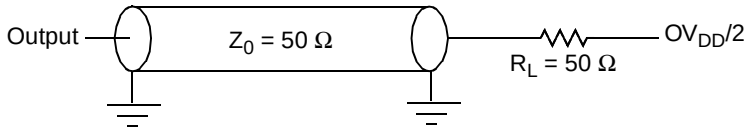

Figure 31. I²C AC Test Load

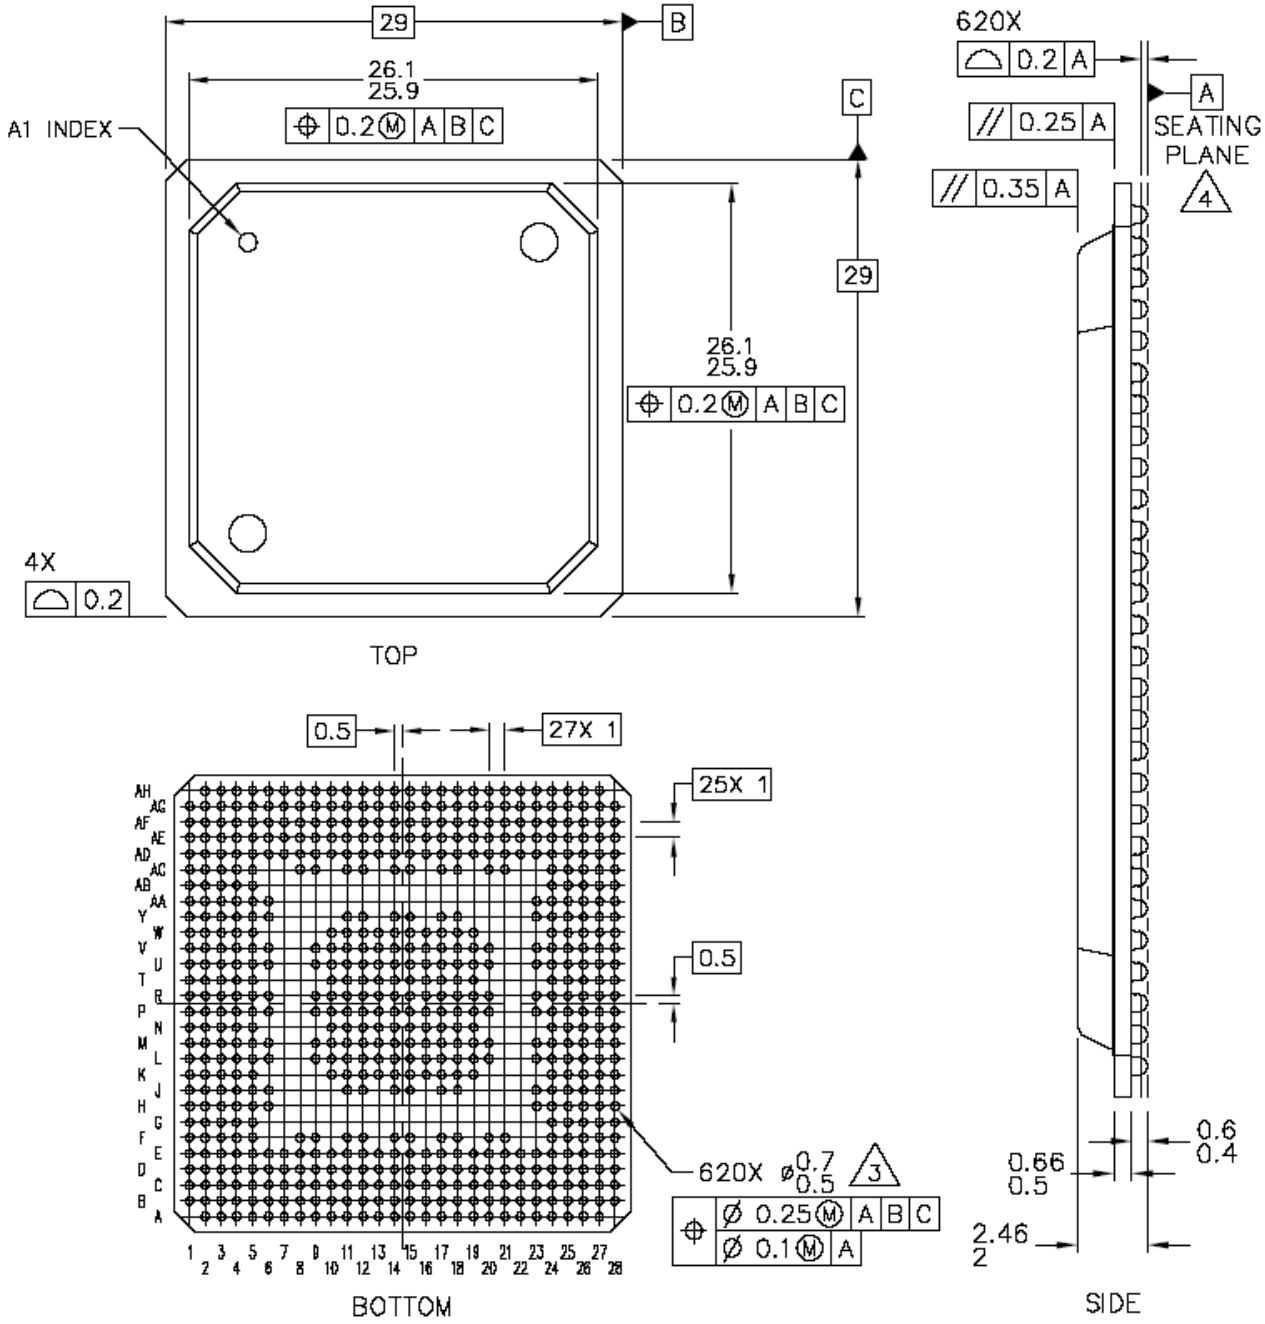
18.4 Mechanical Dimensions for the MPC8347E PBGA

Figure 40 shows the mechanical dimensions and bottom surface nomenclature for the MPC8347E, 620-PBGA package.



Notes:

1.All dimensions are in millimeters.

2.Dimensioning and tolerancing per ASME Y14. 5M-1994.

3.Maximum solder ball diameter measured parallel to datum A.

4.Datum A, the seating plane, is determined by the spherical crowns of the solder balls.

Figure 40. Mechanical Dimensions and Bottom Surface Nomenclature for the MPC8347E PBGA

Notes:

1. This pin is an open-drain signal. A weak pull-up resistor (1 kΩ) should be placed on this pin to OV_{DD}.
2. This pin is an open-drain signal. A weak pull-up resistor (2–10 kΩ) should be placed on this pin to OV_{DD}.
3. During reset, this output is actively driven rather than three-stated.
4. These JTAG pins have weak internal pull-up P-FETs that are always enabled.
5. This pin should have a weak pull-up if the chip is in PCI host mode. Follow the PCI specifications.
6. This pin must always be tied to GND.
7. This pin must always be pulled up to OV_{DD}.
8. This pin must always be left not connected.
9. Thermal sensitive resistor.
10. It is recommended that MDIC0 be tied to GRD using an 18 Ω resistor and MDIC1 be tied to DDR power using an 18 Ω resistor.
11. TSEC1_TXD[3] is required an external pull-up resistor. For proper functionality of the device, this pin must be pulled up or actively driven high during a hard reset. No external pull-down resistors are allowed to be attached to this net.

Table 52 provides the pinout listing for the MPC8347E, 620 PBGA package.

As described in Section 19, “Clocking,” the LBIUCM, DDRCM, and SPMF parameters in the reset configuration word low and the CFG_CLKIN_DIV configuration input signal select the ratio between the primary clock input (CLKIN or PCI_CLK) and the internal coherent system bus clock (*csb_clk*). Table 57 and Table 58 show the expected frequency values for the CSB frequency for select *csb_clk* to CLKIN/PCI_SYNC_IN ratios.

required in the heat sink. Minimize the size of the clearance to minimize the change in thermal performance caused by removing part of the thermal interface to the heat sink. Because of the experimental difficulties with this technique, many engineers measure the heat sink temperature and then back calculate the case temperature using a separate measurement of the thermal resistance of the interface. From this case temperature, the junction temperature is determined from the junction-to-case thermal resistance.

$$T_J = T_C + (R_{\theta JC} \times P_D)$$

where:

T_J = junction temperature (°C)

T_C = case temperature of the package (°C)

$R_{\theta JC}$ = junction-to-case thermal resistance (°C/W)

P_D = power dissipation (W)

21 System Design Information

This section provides electrical and thermal design recommendations for successful application of the MPC8347E.

21.1 System Clocking

The MPC8347E includes two PLLs:

1. The platform PLL generates the platform clock from the externally supplied CLKIN input. The frequency ratio between the platform and CLKIN is selected using the platform PLL ratio configuration bits as described in Section 19.1, “System PLL Configuration.”
2. The e300 core PLL generates the core clock as a slave to the platform clock. The frequency ratio between the e300 core clock and the platform clock is selected using the e300 PLL ratio configuration bits as described in Section 19.2, “Core PLL Configuration.”

21.2 PLL Power Supply Filtering

Each PLL gets power through independent power supply pins ($AV_{DD}1$, $AV_{DD}2$, respectively). The AV_{DD} level should always equal to V_{DD}, and preferably these voltages are derived directly from V_{DD} through a low frequency filter scheme.

There are a number of ways to provide power reliably to the PLLs, but the recommended solution is to provide four independent filter circuits as illustrated in Figure 42, one to each of the four AV_{DD} pins. Independent filters to each PLL reduce the opportunity to cause noise injection from one PLL to the other.

The circuit filters noise in the PLL resonant frequency range from 500 kHz to 10 MHz. It should be built with surface mount capacitors with minimum effective series inductance (ESL). Consistent with the recommendations of Dr. Howard Johnson in *High Speed Digital Design: A Handbook of Black Magic* (Prentice Hall, 1993), multiple small capacitors of equal value are recommended over a single large value capacitor.

To minimize noise coupled from nearby circuits, each circuit should be placed as closely as possible to the specific AV_{DD} pin being supplied. It should be possible to route directly from the capacitors to the AV_{DD} pin, which is on the periphery of package, without the inductance of vias.

Figure 42 shows the PLL power supply filter circuit.

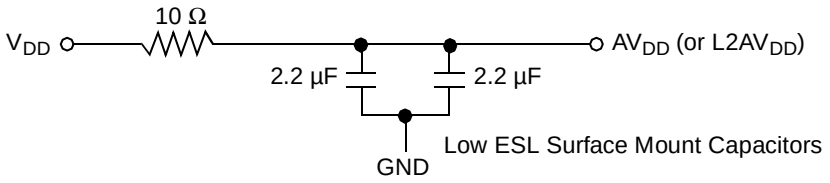

Figure 42. PLL Power Supply Filter Circuit

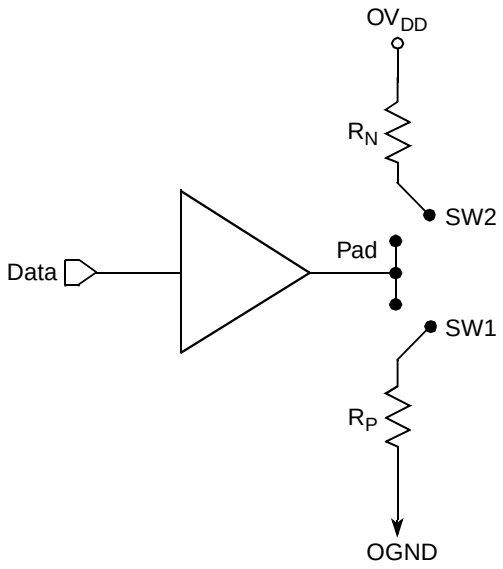

Figure 43. Driver Impedance Measurement

Two measurements give the value of this resistance and the strength of the driver current source. First, the output voltage is measured while driving logic 1 without an external differential termination resistor. The measured voltage is $V_1 = R_{source} \times I_{source}$. Second, the output voltage is measured while driving logic 1 with an external precision differential termination resistor of value R_{term}. The measured voltage is $V_2 = (1/(1/R_1 + 1/R_2)) \times I_{source}$. Solving for the output impedance gives $R_{source} = R_{term} \times (V_1/V_2 - 1)$. The drive current is then $I_{source} = V_1/R_{source}$.

Table 65 summarizes the signal impedance targets. The driver impedance are targeted at minimum V_{DD}, nominal OV_{DD}, 105°C.

Table 65. Impedance Characteristics

Impedance	Local Bus, Ethernet, DUART, Control, Configuration, Power Management	PCI Signals (Not Including PCI Output Clocks)	PCI Output Clocks (Including PCI_SYNC_OUT)	DDR DRAM	Symbol	Unit
R_N	42 Target	25 Target	42 Target	20 Target	Z_0	Ω
R_P	42 Target	25 Target	42 Target	20 Target	Z_0	Ω
Differential	NA	NA	NA	NA	Z_{DIFF}	Ω

Note: Nominal supply voltages. See Table 1, T_j = 105°C.

21.6 Configuration Pin Multiplexing

The MPC8347E power-on configuration options can be set through external pull-up or pull-down resistors of 4.7 kΩ on certain output pins (see the customer-visible configuration pins). These pins are used as output only pins in normal operation.

However, while $\overline{\text{HRESET}}$ is asserted, these pins are treated as inputs, and the value on these pins is latched when $\overline{\text{PORESET}}$ deasserts. Then the input receiver is disabled and the I/O circuit takes on its normal function. Careful board layout with stubless connections to these pull-up/pull-down resistors coupled with

22 Document Revision History

Table 66 provides a revision history of this document.

Table 66. Document Revision History

Revision	Date	Substantive Change(s)
11	2/2009	In Section 21.1, "System Clocking," removed "(AVDD1)" and "(AVDD2") from bulleted list. In Section 21.2, "PLL Power Supply Filtering," in the second paragraph, changed "provide five independent filter circuits," and "the five AVDD pins" to provide four independent filter circuits," and "the four AVDD pins." In Table 35, removed row for rise time (t_{I2CR}). Removed minimum value of t_{I2CF}. Added note 5 stating that the device does not follow the I2C-BUS Specifications version 2.1 regarding the t_{I2CF} AC parameter. In Table 54, corrected the max csb_clk to 266 MHz. In Table 60, added PLL configurations 903, 923, A03, A23, and 503 for 533 MHz In Table 35, corrected t_{LBKHOV} parametr to t_{LBKLOV} (output data is driven on falling edge of clock in DLL bypass mode). Similarly, made the same correction to Figure 21, Figure 23, and Figure 24 for output signals. Added Figure 1 and Figure 4. In Table 9.2, clarified that AC table is for ULPI only. Added footnote 4 to Table 67. In Table 67, updated note 1 to say the following: "For temperature range = C, processor frequency is up to 667(TBGA) with a platform frequency of 333 and limited to 400 (PBGA) with a platform frequency of 266." Added footnote 10 and 11 to Table 51 and Table 52. In Table 51, Table 52, updated note 11 to say the following: "SEC1_TXD[3] is required an external pull-up resistor. For proper functionality of the device, this pin must be pulled up or actively driven high during a hard reset. No external pull-down resistors are allowed to be attached to this net." Added footnote 6 to Table 7. In Table 7, updated the note 6 to say the following: "The Spread spectrum clocking. Is allowed with 1% input frequency down-spread at maximum 50KHz modulation rate regardless of input frequency." In 8.1.1, removed the note "The potential applied to the input of a GMII, MII, TBI, RGMII, or RTBI receiver may exceed the potential of the receiver power supply (that is, a RGMII driver powered from a 3.6 V supply driving VOH into a RGMII receiver powered from a 2.5-V supply). Tolerance for dissimilar RGMII driver and receiver supply potentials is implicit in these specifications."
10	4/2007	In Table 3, "Output Drive Capability," changed the values in the Output Impedance column and added USB to the seventh row. In Table 54, "Operating Frequencies for TBGA," added column for 400 MHz. In Section 21.7, "Pull-Up Resistor Requirements," deleted last two paragraphs and after first paragraph, added a new paragraph. Deleted Section 21.8, "JTAG Configuration Signals," and Figure 43, "JTAG Interface Connection."
9	3/2007	In Table 54, "Operating Frequencies for TBGA," in the 'Coherent system bus frequency (*csb_clk*)' row, changed the value in the 533 MHz column to 100–333. In Table 60, "Suggested PLL Configurations," under the subhead, '33 MHz CLKIN/PCI_CLK Options,' added row A03 between Ref. No. 724 and 804. Under the subhead '66 MHz CLKIN/PCI_CLK Options,' added row 503 between Ref. No. 305 and 404. For Ref. No. 306, changed the CORE PLL value to 0000110. In Section 23, "Ordering Information," replaced first paragraph and added a note. In Section 23.1, "Part Numbers Fully Addressed by This Document," replaced first paragraph.

Table 66. Document Revision History (continued)

Revision	Date	Substantive Change(s)
8	2/2007	Page 1, updated first paragraph to reflect PowerQUICC II information. Updated note after second paragraph. In the features list in Section 1, "Overview," corrected DDR data rate to show: • 266 MHz for PBGA parts for all silicon revisions • 333 MHz for DDR for TBGA parts for silicon Rev. 1.x In Table 5, "MPC8347E Typical I/O Power Dissipation," added GV_{DD} 1.8-V values for DDR2; added table footnote to designate rates that apply only to the TBGA package. In Figure 43, "JTAG Interface Connection," updated with new figure. In Section 23, "Ordering Information," replicated note from document introduction. In Section 23.1, "Part Numbers Fully Addressed by This Document," replaced third sentence of first paragraph directing customer to product summary page for available frequency configuration parts. Updated back page information.
7	8/2006	Changed all references to revision 2.0 silicon to revision 3.0 silicon. Changed V_{IH} minimum value in Table 36, "JTAG Interface DC Electrical Characteristics," to OV_{DD} – 0.3. In Table 60, "Suggested PLL Configurations," deleted reference-number rows 902 and 703.
6	3/2006	Section 2, "Electrical Characteristics," moved to second section and all other section, table, and figure numbering change accordingly. Table 7, "CLKIN AC Timing Specifications:" Changed max rise and fall time from 1.2 to 2.3. Table 22, "GMII Receive AC Timing Specifications:" Changed min t_{TTKHDX} from 0.5 to 1.0. Table 30, "MII Management AC Timing Specifications:" Changed max value of t_{MDKHDX} from 70 to 170. Table 34, "Local Bus General Timing Parameters—DLL on:" Changed min $t_{LBIVKH2}$ from 1.7 to 2.2. Table 36, "JTAG interface DC Electrical Characteristics:" Changed V_{IH} input high voltage min to 2.0. Table 54, "Operating Frequencies for TBGA:" • Updated TBD values. • Changed maximum coherent system bus frequency for TBGA 667-MHz device to 333 MHz. Table 55, "Operating Frequencies for PBGA:" • Updated TBD values. • Changed PBGA maximum coherent system bus frequency to 266 MHz, and maximum DDR memory bus frequency to 133 MHz. Table 60, "Suggested PLL Configurations": Removed some values from suggested PLL configurations for reference numbers 902, 922, 903, and 923. Table 67, "Part Numbering Nomenclature": Updated TBD values in note 1. Added Table 68, "SVR Settings." Added Section 23.2, "Part Marking."
5	10/2005	In Table 57, updated AAVID 30x30x9.4 mm Pin Fin (natural convection) junction-to-ambient thermal resistance, from 11 to 10.
4	9/2005	Added Table 2, "MPC8347E Typical I/O Power Dissipation."
3	8/2005	Table 1: Updated values for power dissipation that were TBD in Revision 2.
2	5/2005	Table 1: Typical values for power dissipation are changed to TBD. Table 48: Footnote numbering was wrong. THERM0 should have footnote 9 instead of 8.
