Understanding [Embedded - CPLDs \(Complex Programmable Logic Devices\)](#)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

Applications of Embedded - CPLDs

Details

Product Status	Obsolete
Programmable Type	In System Programmable
Delay Time tpd(1) Max	10 ns
Voltage Supply - Internal	3V ~ 3.6V
Number of Logic Elements/Blocks	8
Number of Macrocells	128
Number of Gates	2500
Number of I/O	96
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	144-LQFP
Supplier Device Package	144-TQFP (20x20)
Purchase URL	https://www.e-xfl.com/product-detail/intel/epm3128atc144-10

...and More Features

- PCI compatible
- Bus-friendly architecture including programmable slew-rate control
- Open-drain output option
- Programmable macrocell flipflops with individual clear, preset, clock, and clock enable controls
- Programmable power-saving mode for a power reduction of over 50% in each macrocell
- Configurable expander product-term distribution, allowing up to 32 product terms per macrocell
- Programmable security bit for protection of proprietary designs
- Enhanced architectural features, including:
 - 6 or 10 pin- or logic-driven output enable signals
 - Two global clock signals with optional inversion
 - Enhanced interconnect resources for improved routability
 - Programmable output slew-rate control
- Software design support and automatic place-and-route provided by Altera's development systems for Windows-based PCs and Sun SPARCstations, and HP 9000 Series 700/800 workstations
- Additional design entry and simulation support provided by EDIF 2.0.0 and 3.0.0 netlist files, library of parameterized modules (LPM), Verilog HDL, VHDL, and other interfaces to popular EDA tools from third-party manufacturers such as Cadence, Exemplar Logic, Mentor Graphics, OrCAD, Synopsys, Synplicity, and VeriBest
- Programming support with the Altera master programming unit (MPU), MasterBlaster™ communications cable, ByteBlasterMV™ parallel port download cable, BitBlaster™ serial download cable as well as programming hardware from third-party manufacturers and any in-circuit tester that supports Jam™ Standard Test and Programming Language (STAPL) Files (.jam), Jam STAPL Byte-Code Files (.jbc), or Serial Vector Format Files (.svf)

General Description

MAX 3000A devices are low-cost, high-performance devices based on the Altera MAX architecture. Fabricated with advanced CMOS technology, the EEPROM-based MAX 3000A devices operate with a 3.3-V supply voltage and provide 600 to 10,000 usable gates, ISP, pin-to-pin delays as fast as 4.5 ns, and counter speeds of up to 227.3 MHz. MAX 3000A devices in the -4, -5, -6, -7, and -10 speed grades are compatible with the timing requirements of the PCI Special Interest Group (PCI SIG) *PCI Local Bus Specification, Revision 2.2*. See Table 2.

Table 2. MAX 3000A Speed Grades

Device	Speed Grade				
	-4	-5	-6	-7	-10
EPM3032A	✓			✓	✓
EPM3064A	✓			✓	✓
EPM3128A		✓		✓	✓
EPM3256A				✓	✓
EPM3512A				✓	✓

The MAX 3000A architecture supports 100% transistor-to-transistor logic (TTL) emulation and high-density small-scale integration (SSI), medium-scale integration (MSI), and large-scale integration (LSI) logic functions. The MAX 3000A architecture easily integrates multiple devices ranging from PALs, GALs, and 22V10s to MACH and pLSI devices. MAX 3000A devices are available in a wide range of packages, including PLCC, PQFP, and TQFP packages. See Table 3.

Table 3. MAX 3000A Maximum User I/O Pins *Note (1)*

Device	44-Pin PLCC	44-Pin TQFP	100-Pin TQFP	144-Pin TQFP	208-Pin PQFP	256-Pin FineLine BGA
EPM3032A	34	34				
EPM3064A	34	34	66			
EPM3128A			80	96		98
EPM3256A				116	158	161
EPM3512A					172	208

Note:

- (1) When the IEEE Std. 1149.1 (JTAG) interface is used for in-system programming or boundary-scan testing, four I/O pins become JTAG pins.

MAX 3000A devices use CMOS EEPROM cells to implement logic functions. The user-configurable MAX 3000A architecture accommodates a variety of independent combinatorial and sequential logic functions. The devices can be reprogrammed for quick and efficient iterations during design development and debugging cycles, and can be programmed and erased up to 100 times.

MAX 3000A devices contain 32 to 512 macrocells, combined into groups of 16 macrocells called logic array blocks (LABs). Each macrocell has a programmable-AND/fixed-OR array and a configurable register with independently programmable clock, clock enable, clear, and preset functions. To build complex logic functions, each macrocell can be supplemented with shareable expander and high-speed parallel expander product terms to provide up to 32 product terms per macrocell.

MAX 3000A devices provide programmable speed/power optimization. Speed-critical portions of a design can run at high speed/full power, while the remaining portions run at reduced speed/low power. This speed/power optimization feature enables the designer to configure one or more macrocells to operate at 50% or lower power while adding only a nominal timing delay. MAX 3000A devices also provide an option that reduces the slew rate of the output buffers, minimizing noise transients when non-speed-critical signals are switching. The output drivers of all MAX 3000A devices can be set for 2.5 V or 3.3 V, and all input pins are 2.5-V, 3.3-V, and 5.0-V tolerant, allowing MAX 3000A devices to be used in mixed-voltage systems.

MAX 3000A devices are supported by Altera development systems, which are integrated packages that offer schematic, text—including VHDL, Verilog HDL, and the Altera Hardware Description Language (AHDL)—and waveform design entry, compilation and logic synthesis, simulation and timing analysis, and device programming. The software provides EDIF 2.0.0 and 3.0.0, LPM, VHDL, Verilog HDL, and other interfaces for additional design entry and simulation support from other industry-standard PC- and UNIX-workstation-based EDA tools. The software runs on Windows-based PCs, as well as Sun SPARCstation, and HP 9000 Series 700/800 workstations.

For more information on development tools, see the *MAX+PLUS II Programmable Logic Development System & Software Data Sheet* and the *Quartus Programmable Logic Development System & Software Data Sheet*.

Functional Description

The MAX 3000A architecture includes the following elements:

- Logic array blocks (LABs)
- Macrocells
- Expander product terms (shareable and parallel)
- Programmable interconnect array (PIA)
- I/O control blocks

The MAX 3000A architecture includes four dedicated inputs that can be used as general-purpose inputs or as high-speed, global control signals (clock, clear, and two output enable signals) for each macrocell and I/O pin. Figure 1 shows the architecture of MAX 3000A devices.

For registered functions, each macrocell flipflop can be individually programmed to implement D, T, JK, or SR operation with programmable clock control. The flipflop can be bypassed for combinatorial operation. During design entry, the designer specifies the desired flipflop type; the Altera development system software then selects the most efficient flipflop operation for each registered function to optimize resource utilization.

Each programmable register can be clocked in three different modes:

- Global clock signal mode, which achieves the fastest clock-to-output performance.
- Global clock signal enabled by an active-high clock enable. A clock enable is generated by a product term. This mode provides an enable on each flipflop while still achieving the fast clock-to-output performance of the global clock.
- Array clock implemented with a product term. In this mode, the flipflop can be clocked by signals from buried macrocells or I/O pins.

Two global clock signals are available in MAX 3000A devices. As shown in Figure 1, these global clock signals can be the true or the complement of either of the two global clock pins, GCLK1 or GCLK2.

Each register also supports asynchronous preset and clear functions. As shown in Figure 2, the product-term select matrix allocates product terms to control these operations. Although the product-term-driven preset and clear from the register are active high, active-low control can be obtained by inverting the signal within the logic array. In addition, each register clear function can be individually driven by the active-low dedicated global clear pin (GCLRn).

All registers are cleared upon power-up. By default, all registered outputs drive low when the device is powered up. You can set the registered outputs to drive high upon power-up through the Quartus® II software. Quartus II software uses the NOT Gate Push-Back method, which uses an additional macrocell to set the output high. To set this in the Quartus II software, go to the Assignment Editor and set the **Power-Up Level** assignment for the register to **High**.

Expander Product Terms

Although most logic functions can be implemented with the five product terms available in each macrocell, highly complex logic functions require additional product terms. Another macrocell can be used to supply the required logic resources. However, the MAX 3000A architecture also offers both shareable and parallel expander product terms (“expanders”) that provide additional product terms directly to any macrocell in the same LAB. These expanders help ensure that logic is synthesized with the fewest possible logic resources to obtain the fastest possible speed.

Shareable Expanders

Each LAB has 16 shareable expanders that can be viewed as a pool of uncommitted single product terms (one from each macrocell) with inverted outputs that feed back into the logic array. Each shareable expander can be used and shared by any or all macrocells in the LAB to build complex logic functions. Shareable expanders incur a small delay (t_{SEXP}). Figure 3 shows how shareable expanders can feed multiple macrocells.

Figure 3. MAX 3000A Shareable Expanders

Shareable expanders can be shared by any or all macrocells in an LAB.

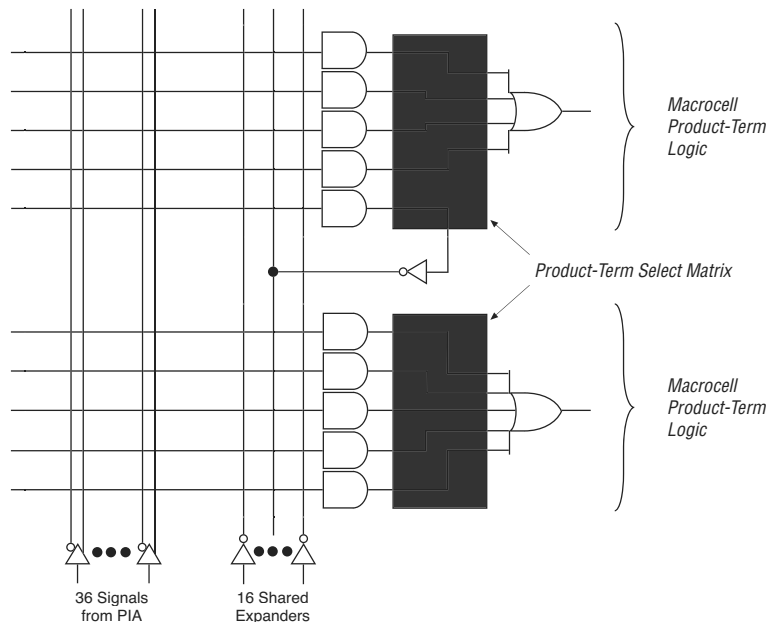

Figure 5. MAX 3000A PIA Routing

While the routing delays of channel-based routing schemes in masked or FPGAs are cumulative, variable, and path-dependent, the MAX 3000A PIA has a predictable delay. The PIA makes a design's timing performance easy to predict.

I/O Control Blocks

The I/O control block allows each I/O pin to be individually configured for input, output, or bidirectional operation. All I/O pins have a tri-state buffer that is individually controlled by one of the global output enable signals or directly connected to ground or V_{CC} . Figure 6 shows the I/O control block for MAX 3000A devices. The I/O control block has 6 or 10 global output enable signals that are driven by the true or complement of two output enable signals, a subset of the I/O pins, or a subset of the I/O macrocells.

Figure 7 shows the timing information for the JTAG signals.

Figure 7. MAX 3000A JTAG Waveforms

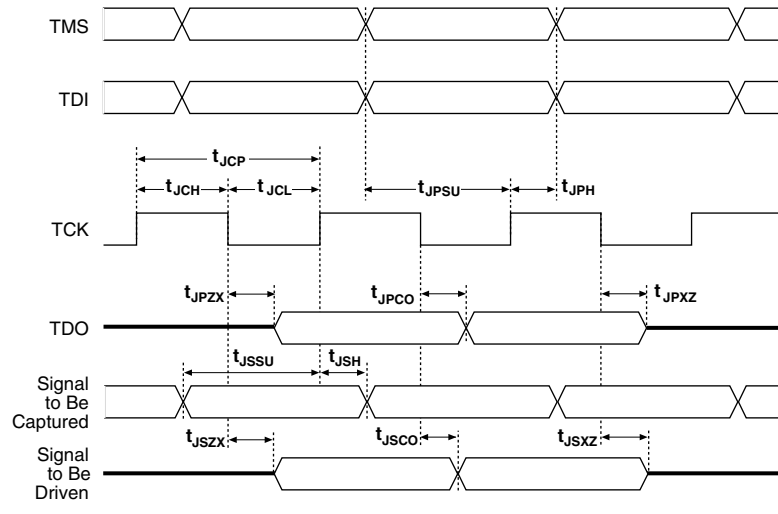

Table 10 shows the JTAG timing parameters and values for MAX 3000A devices.

Table 10. JTAG Timing Parameters & Values for MAX 3000A Devices				
Symbol	Parameter	Min	Max	Unit
t_{JCP}	TCK clock period	100		ns
t_{JCH}	TCK clock high time	50		ns
t_{JCL}	TCK clock low time	50		ns
t_{JPSU}	JTAG port setup time	20		ns
t_{JPH}	JTAG port hold time	45		ns
t_{JPCO}	JTAG port clock to output		25	ns
t_{JPZX}	JTAG port high impedance to valid output		25	ns
t_{JPXZ}	JTAG port valid output to high impedance		25	ns
t_{JSSU}	Capture register setup time	20		ns
t_{JSH}	Capture register hold time	45		ns
t_{JSCO}	Update register clock to output		25	ns
t_{JSZX}	Update register high impedance to valid output		25	ns
t_{JSXZ}	Update register valid output to high impedance		25	ns

Open-Drain Output Option

MAX 3000A devices provide an optional open-drain (equivalent to open-collector) output for each I/O pin. This open-drain output enables the device to provide system-level control signals (e.g., interrupt and write enable signals) that can be asserted by any of several devices. It can also provide an additional wired-OR plane.

Open-drain output pins on MAX 3000A devices (with a pull-up resistor to the 5.0-V supply) can drive 5.0-V CMOS input pins that require a high V_{IH} . When the open-drain pin is active, it will drive low. When the pin is inactive, the resistor will pull up the trace to 5.0 V, thereby meeting CMOS requirements. The open-drain pin will only drive low or tri-state; it will never drive high. The rise time is dependent on the value of the pull-up resistor and load impedance. The I_{OL} current specification should be considered when selecting a pull-up resistor.

Slew-Rate Control

The output buffer for each MAX 3000A I/O pin has an adjustable output slew rate that can be configured for low-noise or high-speed performance. A faster slew rate provides high-speed transitions for high-performance systems. However, these fast transitions may introduce noise transients into the system. A slow slew rate reduces system noise, but adds a nominal delay of 4 to 5 ns. When the configuration cell is turned off, the slew rate is set for low-noise performance. Each I/O pin has an individual EEPROM bit that controls the slew rate, allowing designers to specify the slew rate on a pin-by-pin basis. The slew rate control affects both the rising and falling edges of the output signal.

Design Security

All MAX 3000A devices contain a programmable security bit that controls access to the data programmed into the device. When this bit is programmed, a design implemented in the device cannot be copied or retrieved. This feature provides a high level of design security because programmed data within EEPROM cells is invisible. The security bit that controls this function, as well as all other programmed data, is reset only when the device is reprogrammed.

Generic Testing

MAX 3000A devices are fully tested. Complete testing of each programmable EEPROM bit and all internal logic elements ensures 100% programming yield. AC test measurements are taken under conditions equivalent to those shown in Figure 8. Test patterns can be used and then erased during early stages of the production flow.

Timing Model

MAX 3000A device timing can be analyzed with the Altera software, with a variety of popular industry-standard EDA simulators and timing analyzers, or with the timing model shown in Figure 10. MAX 3000A devices have predictable internal delays that enable the designer to determine the worst-case timing of any design. The software provides timing simulation, point-to-point delay prediction, and detailed timing analysis for device-wide performance evaluation.

Figure 10. MAX 3000A Timing Model

The timing characteristics of any signal path can be derived from the timing model and parameters of a particular device. External timing parameters, which represent pin-to-pin timing delays, can be calculated as the sum of internal parameters. Figure 11 shows the timing relationship between internal and external delay parameters.

Figure 11. MAX 3000A Switching Waveforms

t_R & $t_F < 2$ ns. Inputs are driven at 3 V for a logic high and 0 V for a logic low. All timing characteristics are measured at 1.5 V.

t_{OD2}	Output buffer and pad delay, slow slew rate = off $V_{CCIO} = 2.5\text{ V}$	$C1 = 35\text{ pF}$		1.7		2.1	ns
t_{OD3}	Output buffer and pad delay, slow slew rate = on $V_{CCIO} = 2.5\text{ V}$ or 3.3 V	$C1 = 35\text{ pF}$		6.2		6.6	ns
t_{ZX1}	Output buffer enable delay, slow slew rate = off $V_{CCIO} = 3.3\text{ V}$	$C1 = 35\text{ pF}$		4.0		5.0	ns
t_{ZX2}	Output buffer enable delay, slow slew rate = off $V_{CCIO} = 2.5\text{ V}$	$C1 = 35\text{ pF}$		4.5		5.5	ns

Table 23. EPM3256A Internal Timing Parameters (Part 2 of 2) *Note (1)*

Symbol	Parameter	Conditions	Speed Grade				Unit
			−7		−10		
			Min	Max	Min	Max	
t_{ZX3}	Output buffer enable delay, slow slew rate = on $V_{CCIO} = 2.5\text{ V}$ or 3.3 V	$C1 = 35\text{ pF}$		9.0		10.0	ns
t_{XZ}	Output buffer disable delay	$C1 = 5\text{ pF}$		4.0		5.0	ns
t_{SU}	Register setup time		2.1		2.9		ns
t_H	Register hold time		0.9		1.2		ns
t_{RD}	Register delay			1.2		1.6	ns
t_{COMB}	Combinatorial delay			0.8		1.2	ns
t_{IC}	Array clock delay			1.6		2.1	ns
t_{EN}	Register enable time			1.0		1.3	ns
t_{GLOB}	Global control delay			1.5		2.0	ns
t_{PRE}	Register preset time			2.3		3.0	ns
t_{CLR}	Register clear time			2.3		3.0	ns
t_{PIA}	PIA delay	(2)		2.4		3.2	ns
t_{LPA}	Low-power adder	(5)		4.0		5.0	ns

Table 24. EPM3512A External Timing Parameters *Note (1)*

Symbol	Parameter	Conditions	Speed Grade				Unit
			-7		-10		
			Min	Max	Min	Max	
t _{PD1}	Input to non-registered output	C1 = 35 pF (2)		7.5		10.0	ns
t _{PD2}	I/O input to non-registered output	C1 = 35 pF (2)		7.5		10.0	ns
t _{SU}	Global clock setup time	(2)	5.6		7.6		ns
t _H	Global clock hold time	(2)	0.0		0.0		ns
t _{FSU}	Global clock setup time of fast input		3.0		3.0		ns
t _{FH}	Global clock hold time of fast input		0.0		0.0		ns
t _{CO1}	Global clock to output delay	C1 = 35 pF	1.0	4.7	1.0	6.3	ns
t _{CH}	Global clock high time		3.0		4.0		ns
t _{CL}	Global clock low time		3.0		4.0		ns
t _{ASU}	Array clock setup time	(2)	2.5		3.5		ns

Table 25. EPM3512A Internal Timing Parameters (Part 2 of 2) *Note (1)*

Symbol	Parameter	Conditions	Speed Grade				Unit
			-7		-10		
			Min	Max	Min	Max	
t_{OD3}	Output buffer and pad delay, slow slew rate = on $V_{CCIO} = 2.5\text{ V}$ or 3.3 V	$C1 = 35\text{ pF}$		6.0		6.5	ns
t_{ZX1}	Output buffer enable delay, slow slew rate = off $V_{CCIO} = 3.3\text{ V}$	$C1 = 35\text{ pF}$		4.0		5.0	ns
t_{ZX2}	Output buffer enable delay, slow slew rate = off $V_{CCIO} = 2.5\text{ V}$	$C1 = 35\text{ pF}$		4.5		5.5	ns
t_{ZX3}	Output buffer enable delay, slow slew rate = on $V_{CCIO} = 3.3\text{ V}$	$C1 = 35\text{ pF}$		9.0		10.0	ns
t_{XZ}	Output buffer disable delay	$C1 = 5\text{ pF}$		4.0		5.0	ns
t_{SU}	Register setup time		2.1		3.0		ns
t_H	Register hold time		0.6		0.8		ns
t_{FSU}	Register setup time of fast input		1.6		1.6		ns
t_{FH}	Register hold time of fast input		1.4		1.4		ns
t_{RD}	Register delay			1.3		1.7	ns
t_{COMB}	Combinatorial delay			0.6		0.8	ns
t_{IC}	Array clock delay			1.8		2.3	ns
t_{EN}	Register enable time			1.0		1.3	ns
t_{GLOB}	Global control delay			1.7		2.2	ns
t_{PRE}	Register preset time			1.0		1.4	ns
t_{CLR}	Register clear time			1.0		1.4	ns
t_{PIA}	PIA delay	(2)		3.0		4.0	ns
t_{LPA}	Low-power adder	(5)		4.5		5.0	ns

Notes to tables:

- These values are specified under the recommended operating conditions, as shown in Table 13 on page 23. See Figure 11 on page 27 for more information on switching waveforms.
- These values are specified for a PIA fan-out of one LAB (16 macrocells). For each additional LAB fan-out in these devices, add an additional 0.1 ns to the PIA timing value.
- This minimum pulse width for preset and clear applies for both global clear and array controls. The t_{LPA} parameter must be added to this minimum width if the clear or reset signal incorporates the t_{LAD} parameter into the signal path.
- These parameters are measured with a 16-bit loadable, enabled, up/down counter programmed into each LAB.
- The t_{LPA} parameter must be added to the t_{LAD} , t_{LAC} , t_{IC} , t_{EN} , t_{SEXP} , t_{ACL} , and t_{CPPW} parameters for macrocells running in low-power mode.

Figure 13. I_{CC} vs. Frequency for MAX 3000A Devices**EPM3256A****EPM3512A**

Version 3.3

The following changes were made in the *MAX 3000A Programmable Logic Device Data Sheet* version 3.3:

- Updated Tables 3, 13, and 26.
- Added Tables 4 through 6.
- Updated Figures 12 and 13.
- Added “Programming Sequence” on page 14 and “Programming Times” on page 14

Version 3.2

The following change were made in the *MAX 3000A Programmable Logic Device Data Sheet* version 3.2:

- Updated the EPM3512 I_{CC} versus frequency graph in Figure 13.

Version 3.1

The following changes were made in the *MAX 3000A Programmable Logic Device Data Sheet* version 3.1:

- Updated timing information in Table 1 for the EPM3256A device.
- Updated *Note (10)* of Table 15.

Version 3.0

The following changes were made in the *MAX 3000A Programmable Logic Device Data Sheet* version 3.0:

- Added EPM3512A device.
- Updated Tables 2 and 3.
