

Welcome to **E-XFL.COM** 

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "<u>Embedded - Microcontrollers</u>"

Details	
Product Status	Obsolete
Core Processor	Z8
Core Size	8-Bit
Speed	12MHz
Connectivity	-
Peripherals	POR, WDT
Number of I/O	14
Program Memory Size	1KB (1K x 8)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	125 x 8
Voltage - Supply (Vcc/Vdd)	4.5V ~ 5.5V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Through Hole
Package / Case	18-DIP (0.300", 7.62mm)
Supplier Device Package	-
Purchase URL	https://www.e-xfl.com/product-detail/zilog/z86e0412pec

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

## **GENERAL DESCRIPTION** (Continued)

#### STANDARD TEST CONDITIONS

The characteristics listed below apply for standard test conditions as noted. All voltages are referenced to Ground. Positive current flows into the referenced pin (Figure 5).

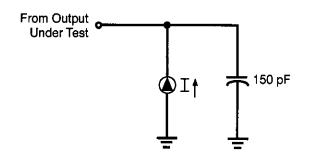

Figure 5. Test Load Diagram

#### **CAPACITANCE**

 $T_A = 25$ °C,  $V_{CC} = GND = 0V$ , f = 1.0 MHz, unmeasured pins returned to GND.

Parameter	Min	Max
Input capacitance	0	10 pF
Output capacitance	0	20 pF
I/O capacitance	0	25 pF

Sym	Parameter	V <sub>cc</sub> [4]	T <sub>A</sub> = -40°C to +105°C Min Max	Typical @ 25°C	Units	Conditions	Notes
I <sub>CC1</sub>	Standby Current (Low Noise Mode)	4.5V	4.0	2.5	mA	HALT Mode V <sub>IN</sub> = 0V, V <sub>CC</sub> @ 1 MHz	7
		5.5V	4.0	2.5	mA	HALT Mode V <sub>IN</sub> = 0V, V <sub>CC</sub> @ 1 MHz	7
		4.5V	4.5	2.8	mA	HALT Mode V <sub>IN</sub> = 0V, V <sub>CC</sub> @ 2 MHz	7
		5.5V	4.5	2.8	mA	HALT Mode V <sub>IN</sub> = 0V, V <sub>CC</sub> @ 2 MHz	7
		4.5V	5.0	3.0	mA	HALT Mode V <sub>IN</sub> = 0V, V <sub>CC</sub> @ 4 MHz	7
		5.5V	5.0	3.0	mA	HALT Mode V <sub>IN</sub> = 0V, V <sub>CC</sub> @ 4 MHz	7
I <sub>CC2</sub>	Standby Current	4.5V	20	1.0	μА	STOP Mode $V_{IN} = 0V, V_{CC}$ WDT is not Running	7,8
		5.5V	20	1.0	μА	STOP Mode V <sub>IN</sub> = 0V, V <sub>CC</sub> WDT is not Running	7,8
I <sub>ALL</sub>	Auto Latch Low	4.5V	40	16	μА	OV < V <sub>IN</sub> < V <sub>CC</sub>	
	Current	5.5V	40	16	μА	OV < V <sub>IN</sub> < V <sub>CC</sub>	
I <sub>ALH</sub>	Auto Latch High	4.5V	-20.0	-8.0	μА	OV < V <sub>IN</sub> < V <sub>CC</sub>	
	Current	5.5V	-20.0	-8.0	μА	0V < V <sub>IN</sub> < V <sub>CC</sub>	

- 1. Port 2 and Port 0 only
- 2.  $V_{SS} = 0V = GND$
- 3. The device operates down to  $V_{LV}$  of the specified frequency for  $V_{LV}$ . The minimum operational  $V_{CC}$  is determined on the value of the voltage  $V_{LV}$  at the ambient temperature. The  $V_{LV}$  increases as the temperature decreases.
- 4.  $V_{CC}$  = 4.5V to 5.5V, typical values measured at  $V_{CC}$  = 5.0V
- 5. Standard Mode (not Low EMI Mode)
- 6. Z86E08 only
- 7. All outputs unloaded and all inputs are at  $V_{CC}$  or  $V_{SS}$  level.
- 8. If analog comparator is selected, then the comparator inputs must be at  $V_{\text{CC}}$  level.

#### **LOW NOISE VERSION**

#### Low EMI Emission

The Z86E04/E08 can be programmed to operate in a Low EMI Emission Mode by means of a mask ROM bit option. Use of this feature results in:

- All pre-driver slew rates reduced to 10 ns typical.
- Internal SCLK/TCLK operation limited to a maximum of 4 MHz-250 ns cycle time.
- Output drivers have resistances of 500 Ohms (typical).
- Oscillator divide-by-two circuitry eliminated.

The Low EMI Mode is mask-programmable to be selected by the customer at the time the ROM code is submitted.

#### PIN FUNCTIONS

### **OTP Programming Mode**

**D7–D0** Data Bus. Data can be read from, or written to, the EPROM through this data bus.

 $V_{\rm CC}$  Power Supply. It is typically 5V during EPROM Read Mode and 6.4V during the other modes (Program, Program Verify, and so on).

**CE** Chip Enable (active Low). This pin is active during EPROM Read Mode, Program Mode, and Program Verify Mode.

**OE** Output Enable (active Low). This pin drives the Data Bus direction. When this pin is Low, the Data Bus is output. When High, the Data Bus is input.

**EPM** *EPROM Program Mode.* This pin controls the different EPROM Program Modes by applying different voltages.

 $\mathbf{V}_{\mathsf{PP}}$  Program Voltage. This pin supplies the program voltage.

Clear Clear (active High). This pin resets the internal address counter at the High Level.

**Clock** Address Clock. This pin is a clock input. The internal address counter increases by one with one clock cycle.

**PGM** Program Mode (active Low). A Low level at this pin programs the data to the EPROM through the Data Bus.

### **Application Precaution**

The production test-mode environment may be enabled accidentally during normal operation if *excessive noise* surges above V<sub>CC</sub> occur on the XTAL1 pin.

In addition, processor operation of Z8 OTP devices may be affected by *excessive noise* surges on the  $V_{pp}$ ,  $\overline{CE}$ , EPM,  $\overline{OE}$  pins while the microcontroller is in Standard Mode.

Recommendations for dampening voltage surges in both test and OTP Mode include the following:

- Using a clamping diode to V<sub>CC</sub>.
- Adding a capacitor to the affected pin.

**Note:** Programming the EPROM/Test Mode Disable option will prevent accidental entry into EPROM Mode or Test Mode.

### PIN FUNCTIONS (Continued)

**XTAL1, XTAL2** Crystal In, Crystal Out (time-based input and output, respectively). These pins connect a parallel-resonant crystal, LC, or an external single-phase clock (8 MHz or 12 MHz max) to the on-chip clock oscillator and buffer.

**Port 0, P02—P00.** Port 0 is a 3-bit bidirectional, Schmitt-triggered CMOS-compatible I/O port. These three I/O lines can be globally configured under software control to be inputs or outputs (Figure 7).

**Auto Latch.** The Auto Latch puts valid CMOS levels on all CMOS inputs (except P33, P32, P31) that are not externally driven. A valid CMOS level, rather than a floating node, reduces excessive supply current flow in the input buffer. On Power-up and Reset, the Auto Latch will set the ports to an undetermined state of 0 or 1. Default condition is Auto Latches enabled.

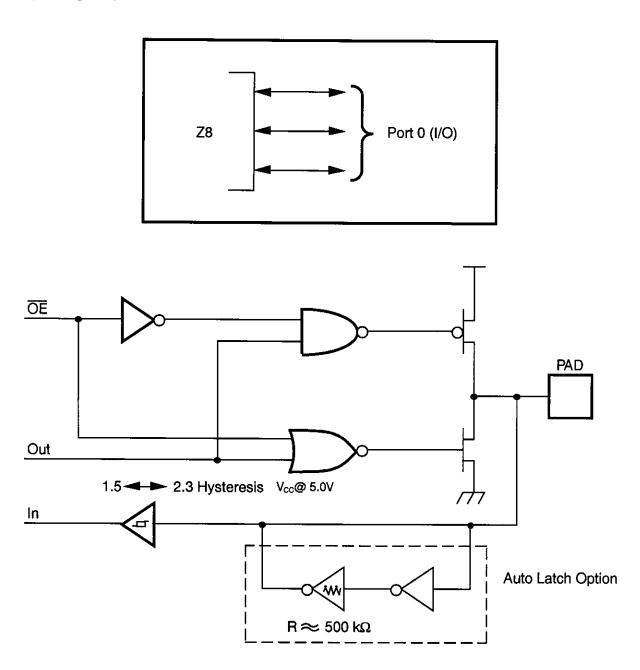

Figure 7. Port 0 Configuration

Comparator Inputs. Two analog comparators are added to input of Port 3, P31, and P32, for interface flexibility. The comparators reference voltage P33 (REF) is common to both comparators.

Typical applications for the on-board comparators; Zero crossing detection, A/D conversion, voltage scaling, and threshold detection. In Analog Mode, P33 input functions serve as a reference voltage to the comparators.

The dual comparator (common inverting terminal) features a single power supply which discontinues power in STOP

Mode. The common voltage range is 0–4 V when the  $V_{\rm CC}$  is 5.0V; the power supply and common mode rejection ratios are 90 dB and 60 dB, respectively.

Interrupts are generated on either edge of Comparator 2's output, or on the falling edge of Comparator 1's output. The comparator output is used for interrupt generation, Port 3 data inputs, or T<sub>IN</sub> through P31. Alternatively, the comparators can be disabled, freeing the reference input (P33) for use as IRQ1 and/or P33 input.

#### **FUNCTIONAL DESCRIPTION**

The following special functions have been incorporated into the Z8 devices to enhance the standard Z8 core architecture to provide the user with increased design flexibility.

**RESET.** This function is accomplished by means of a Power-On Reset or a Watch-Dog Timer Reset. Upon power-up, the Power-On Reset circuit waits for T<sub>POR</sub> ms, plus 18 clock cycles, then starts program execution at address 000C (Hex) (Figure 10). The Z8 control registers' reset value is shown in Table 3.

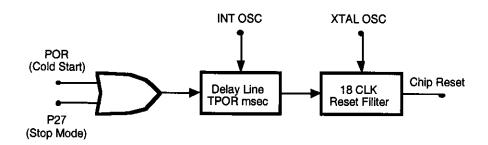

Figure 10. Internal Reset Configuration

**Power-On Reset (POR).** A timer circuit clocked by a dedicated on-board RC oscillator is used for a POR timer function. The POR time allows  $V_{\rm CC}$  and the oscillator circuit to stabilize before instruction execution begins. The POR timer circuit is a one-shot timer triggered by one of the four following conditions:

- Power-bad to power-good status
- Stop-Mode Recovery
- WDT time-out
- WDH time-out

Watch-Dog Timer Reset. The WDT is a retriggerable one-shot timer that resets the Z8 if it reaches its terminal count. The WDT is initially enabled by executing the WDT instruction and is retriggered on subsequent execution of the WDT instruction. The timer circuit is driven by an on-board RC oscillator.

The Z8 instructions can access registers directly or indirectly through an 8-bit address field. This allows short 4-bit register addressing using the Register Pointer.

In the 4-bit mode, the register file is divided into eight working register groups, each occupying 16 continuous locations. The Register Pointer (Figure 13) addresses the starting location of the active working-register group.

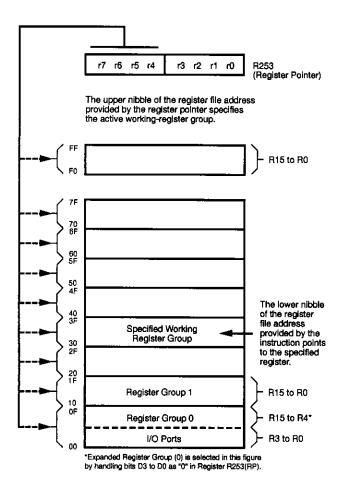

Figure 13. Register Pointer

**Stack Pointer.** The Z8 has an 8-bit Stack Pointer (R255) used for the internal stack that resides within the 124 general-purpose registers.

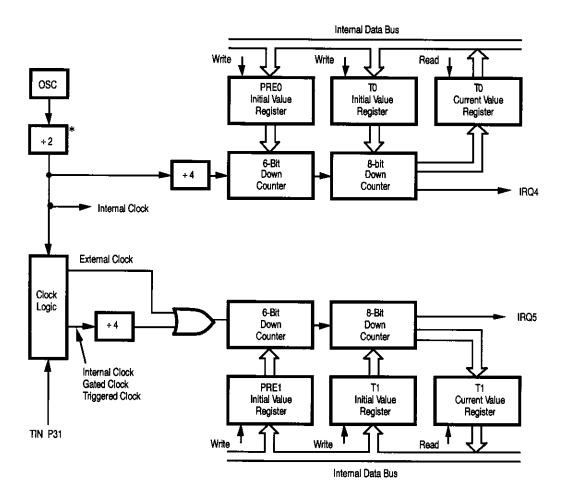

**General-Purpose Registers (GPR).** These registers are undefined after the device is powered up. The registers keep their last value after any reset, as long as the reset occurs in the  $V_{\rm CC}$  voltage-specified operating range. **Note:** Register R254 has been designated as a general-purpose register and is set to 00 Hex after any reset or Stop-Mode Recovery.

**Counter/Timer.** There are two 8-bit programmable counter/timers (T0 and T1), each driven by its own 6-bit programmable prescaler. The T1 prescaler is driven by internal or external clock sources; however, the T0 can be driven by the internal clock source only (Figure 14).

The 6-bit prescalers divide the input frequency of the clock source by any integer number from 1 to 64. Each prescaler drives its counter, which decrements the value (1 to 256) that has been loaded into the counter. When both counter and prescaler reach the end of count, a timer interrupt request IRQ4 (T0) or IRQ5 (T1) is generated.

The counter can be programmed to start, stop, restart to continue, or restart from the initial value. The counters are also programmed to stop upon reaching zero (Single-Pass Mode) or to automatically reload the initial value and continue counting (Modulo-N Continuous Mode).

The counters, but not the prescalers, are read at any time without disturbing their value or count mode. The clock source for T1 is user-definable and is either the internal microprocessor clock divided by four, or an external signal input through Port 3. The Timer Mode register configures the external timer input (P31) as an external clock, a trigger input that is retriggerable or non-retriggerable, or used as a gate input for the internal clock.

<sup>\*</sup> Note: By passed, if Low EMI Mode is selected.

Figure 14. Counter/Timers Block Diagram

Interrupts. The Z8 has six interrupts from six different sources. These interrupts are maskable and prioritized (Figure 15). The sources are divided as follows: the falling edge of P31 (AN1), P32 (AN2), P33 (REF), the rising edge of P32 (AN2), and two counter/timers. The Interrupt Mask Register globally or individually enables or disables the six interrupt requests (Table 4).

When more than one interrupt is pending, priorities are resolved by a programmable priority encoder that is controlled by the Interrupt Priority register. All Z8 interrupts are vectored through locations in program memory. When an Interrupt machine cycle is activated, an Interrupt Request is granted. This disables all subsequent interrupts, saves the Program Counter and Status Flags, and then branches to the program memory vector location reserved for that interrupt. This memory location and the next byte contain the 16-bit starting address of the interrupt service routine for that particular interrupt request.

To accommodate polled interrupt systems, interrupt inputs are masked and the interrupt request register is polled to determine which of the interrupt requests needs service.

Note: User must select any Z86E08 mode in Zilog's C12 ICEBOX<sup>™</sup> emulator. The rising edge interrupt is not supported on the CCP emulator (a hardware/software workaround must be employed).

Table 4. Interrupt Types, Sources, and Vectors

Name	Source	Vector Location	Comments
IRQ0	AN2(P32)	0,1	External (F)Edge
IRQ1	REF(P33)	2,3	External (F)Edge
IRQ2	AN1(P31)	4,5	External (F)Edge
IRQ3	AN2(P32)	6,7	External (R)Edge
IRQ4	TO	8,9	Internal
IRQ5	T1	10,11	Internal

#### Notes:

F = Falling edge triggered

R = Rising edge triggered

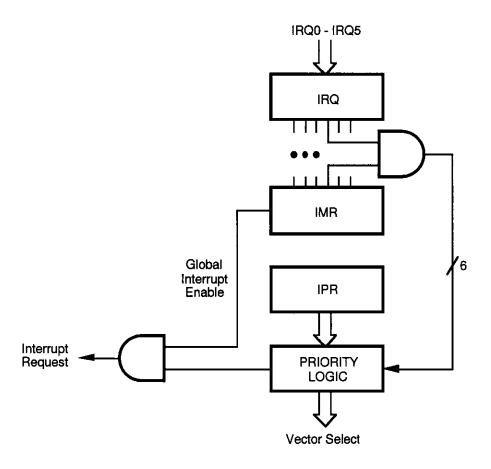

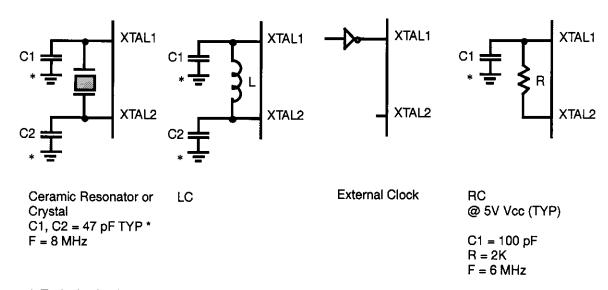

Figure 15. Interrupt Block Dlagram

Clock. The Z8 on-chip oscillator has a high-gain, parallel-resonant amplifier for connection to a crystal, LC, RC, ceramic resonator, or any suitable external clock source (XTAL1 = INPUT, XTAL2 = OUTPUT). The crystal should be AT cut, up to 12 MHz max., with a series resistance (RS) of less than or equal to 100 Ohms.

The crystal should be connected across XTAL1 and XTAL2 using the vendors crystal recommended capacitors from each pin directly to device ground pin 14 (Figure 16). Note that the crystal capacitor loads should be connected to  $V_{\rm SS}$ , Pin 14 to reduce Ground noise injection.

<sup>\*</sup> Typical value including pin parasitics

Figure 16. Oscillator Configuration

### **Low EMI Emission**

The Z8 can be programmed to operate in a low EMI Emission (Low Noise) Mode by means of an EPROM programmable bit option. Use of this feature results in:

- Less than 1 mA consumed during HALT Mode.
- All drivers slew rates reduced to 10 ns (typical).
- Internal SCLK/TCLK = XTAL operation limited to a maximum of 4 MHz-250 ns cycle time.
- Output drivers have resistances of 500 ohms (typical).
- Oscillator divide-by-two circuitry eliminated.

In addition to  $V_{DD}$  and GND ( $V_{SS}$ ), the Z8 changes all its pin functions in the EPROM Mode. XTAL2 has no function, XTAL1 functions as  $\overline{CE}$ , P31 functions as  $\overline{OE}$ , P32 functions as EPM, P33 functions as  $V_{PP}$ , and P02 functions as  $\overline{PGM}$ .

ROM Protect. ROM Protect fully protects the Z8 ROM code from being read externally. When ROM Protect is selected, the instructions LDC and LDCI are supported (Z86E04/E08 and Z86C04/C08 do not support the instructions of LDE and LDEI). When the device is programmed for ROM Protect, the Low Noise feature will not automatically be enabled.

Please note that when using the device in a noisy environment, it is suggested that the voltages on the EPM and  $\overline{\text{CE}}$  pins be clamped to  $V_{\text{CC}}$  through a diode to  $V_{\text{CC}}$  to prevent accidentally entering the OTP Mode. The  $V_{\text{PP}}$  requires both a diode and a 100 pF capacitor.

Auto Latch Disable. Auto Latch Disable option bit when programmed will globally disable all Auto Latches.

**WDT Enable.** The WDT Enable option bit, when programmed, will have the hardware enabled Permanent WDT enabled after exiting reset and can not be stopped in Halt or Stop Mode.

**EPROM/Test Mode Disable.** The EPROM/Test Mode Disable option bit, when programmed, will disable the EPROM Mode and the Factory Test Mode. Reading, verifying, and programming the Z8 will be disabled. To fully verify that this mode is disabled, the device must be power cycled.

**User Modes.** Table 7 shows the programming voltage of each mode.

**Table 7. OTP Programming Table**

- 1.  $V_H = 12.75V \pm 0.25 V_{DC}$ .
- 2. V<sub>IH</sub> = As per specific Z8 DC specification.
- 3. V<sub>IL</sub>= As per specific Z8 DC specification.
- 4. X = Not used, but must be set to  $V_H$  or  $V_{IH}$  level.
- 5. NU = Not used, but must be set to either  $V_{IH}$  or  $V_{IL}$  level.
- 6. Ipp during programming = 40 mA maximum.
- I<sub>CC</sub> during programming, verify, or read = 40 mA maximum.
- 8. \* V<sub>CC</sub> has a tolerance of ±0.25V.

Internal Address Counter. The address of Z8 is generated internally with a counter clocked through pin P01 (Clock). Each clock signal increases the address by one and the "high" level of pin P00 (Clear) will reset the address to zero. Figure 18 shows the setup time of the serial address input.

**Programming Waveform.** Figures 19, 20, 21 and 22 show the programming waveforms of each mode. Table 8 shows the timing of programming waveforms.

**Programming Algorithm.** Figure 23 shows the flow chart of the Z8 programming algorithm.

**Table 8. Timing of Programming Waveforms** 

Parameters	Name	Min	Max	Units
1	Address Setup Time	2		μs
2	Data Setup Time	2		μs
3	V <sub>PP</sub> Setup	2		μs
4	V <sub>cc</sub> Setup Time	2		μs
5	Chip Enable Setup Time	2	·· · · ·	μS
6	Program Pulse Width	0.95		ms
7	Data Hold Time	2	,	μS
8	OE Setup Time	2		μЅ
9	Data Access Time	188		ns
10	Data Output Float Time		100	ns
11	Overprogram Pulse Width	2.85		ms
12	EPM Setup Time	2		μS
13	PGM Setup Time	2		μs
14	Address to OE Setup Time	2		μs
15	Option Program Pulse Width	78		ms
16	OE Width	250	, <u></u>	ns
17	Address Valid to OE Low	125	<del></del>	ns
