Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	Z8
Core Size	8-Bit
Speed	12MHz
Connectivity	-
Peripherals	POR, WDT
Number of I/O	14
Program Memory Size	2KB (2K x 8)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	125 x 8
Voltage - Supply (Vcc/Vdd)	4.5V ~ 5.5V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	20-SSOP (0.209", 5.30mm Width)
Supplier Device Package	-
Purchase URL	https://www.e-xfl.com/product-detail/zilog/z86e0812hec1866tr

15–18	D0–D3	Data 0,1, 2, 3	In/Output

Table 2. 18-Pin DIP/SOIC Pin Identification

Standard Mode			
Pin #	**Symbol**	**Function**	**Direction**
1–4	P24–P27	Port 2, Pins 4,5,6,7	In/Output
5	V_{CC}	Power Supply	
6	XTAL2	Crystal Osc. Clock	Output
7	XTAL1	Crystal Osc. Clock	Input
8	P31	Port 3, Pin 1, AN1	Input
9	P32	Port 3, Pin 2, AN2	Input
10	P33	Port 3, Pin 3, REF	Input
11–13	P00–P02	Port 0, Pins 0,1,2	In/Output
14	GND	Ground	
15–18	P20–P23	Port 2, Pins 0,1,2,3	In/Output

STANDARD TEST CONDITIONS

The characteristics listed below apply for standard test conditions as noted. All voltages are referenced to Ground. Positive current flows into the referenced pin (Figure 5).

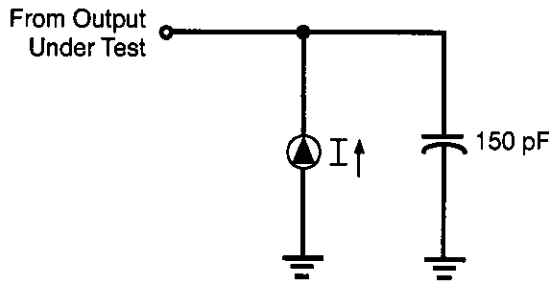

Figure 5. Test Load Diagram

CAPACITANCE

T_A = 25°C, V_{CC} = GND = 0V, f = 1.0 MHz, unmeasured pins returned to GND.

Parameter	Min	Max
Input capacitance	0	10 pF
Output capacitance	0	20 pF
I/O capacitance	0	25 pF

I_{CC2}	Standby Current	4.5V		20	1.0	µA	STOP Mode V_{IN} = 0V, V_{CC} WDT is not Running	7,8
		5.5V		20	1.0	µA	STOP Mode V_{IN} = 0V, V_{CC} WDT is not Running	7,8
I_{ALL}	Auto Latch Low Current	4.5V		40	16	µA	$0V < V_{IN} < V_{CC}$	
		5.5V		40	16	µA	$0V < V_{IN} < V_{CC}$	
I_{ALH}	Auto Latch High Current	4.5V		–20.0	–8.0	µA	$0V < V_{IN} < V_{CC}$	
		5.5V		–20.0	–8.0	µA	$0V < V_{IN} < V_{CC}$	

Notes:

1. Port 2 and Port 0 only
2. V_{SS} = 0V = GND
3. The device operates down to V_{LV} of the specified frequency for V_{LV}. The minimum operational V_{CC} is determined on the value of the voltage V_{LV} at the ambient temperature. The V_{LV} increases as the temperature decreases.
4. V_{CC} = 4.5V to 5.5V, typical values measured at V_{CC} = 5.0V
5. Standard Mode (not Low EMI Mode)
6. Z86E08 only
7. All outputs unloaded and all inputs are at V_{CC} or V_{SS} level.
8. If analog comparator is selected, then the comparator inputs must be at V_{CC} level.

AC ELECTRICAL CHARACTERISTICS

Timing Table (Standard Mode for SCLK/TCLK = XTAL/2)
Standard Temperature

15				T_A= 0 °C to +70 °C

Notes:

1. Timing Reference uses 0.7 V_{CC} for a logic 1 and 0.2 V_{CC} for a logic 0.
2. Interrupt request made through Port 3 (P33–P31).

LOW NOISE VERSION

Low EMI Emission

The Z86E04/E08 can be programmed to operate in a Low EMI Emission Mode by means of a mask ROM bit option. Use of this feature results in:

- All pre-driver slew rates reduced to 10 ns typical.
- Internal SCLK/TCLK operation limited to a maximum of 4 MHz–250 ns cycle time.
- Output drivers have resistances of 500 Ohms (typical).
- Oscillator divide-by-two circuitry eliminated.

The Low EMI Mode is mask-programmable to be selected by the customer at the time the ROM code is submitted.

PIN FUNCTIONS

OTP Programming Mode

D7–D0 *Data Bus.* Data can be read from, or written to, the EPROM through this data bus.

V_{CC} *Power Supply.* It is typically 5V during EPROM Read Mode and 6.4V during the other modes (Program, Program Verify, and so on).

$\overline{CE}$ *Chip Enable* (active Low). This pin is active during EPROM Read Mode, Program Mode, and Program Verify Mode.

$\overline{OE}$ *Output Enable* (active Low). This pin drives the Data Bus direction. When this pin is Low, the Data Bus is output. When High, the Data Bus is input.

EPM *EPROM Program Mode.* This pin controls the different EPROM Program Modes by applying different voltages.

V_{PP} *Program Voltage.* This pin supplies the program voltage.

Clear *Clear* (active High). This pin resets the internal address counter at the High Level.

Clock *Address Clock.* This pin is a clock input. The internal address counter increases by one with one clock cycle.

$\overline{PGM}$ *Program Mode* (active Low). A Low level at this pin programs the data to the EPROM through the Data Bus.

Application Precaution

The production test-mode environment may be enabled accidentally during normal operation if ***excessive noise*** surges above V_{CC} occur on the XTAL1 pin.

In addition, processor operation of Z8 OTP devices may be affected by ***excessive noise*** surges on the V_{PP}, $\overline{CE}$, EPM, $\overline{OE}$ pins while the microcontroller is in Standard Mode.

Recommendations for dampening voltage surges in both test and OTP Mode include the following:

- Using a clamping diode to V_{CC}.
- Adding a capacitor to the affected pin.

Note: Programming the EPROM/Test Mode Disable option will prevent accidental entry into EPROM Mode or Test Mode.

PIN FUNCTIONS (Continued)

XTAL1, XTAL2 *Crystal In, Crystal Out* (time-based input and output, respectively). These pins connect a parallel-resonant crystal, LC, or an external single-phase clock (8 MHz or 12 MHz max) to the on-chip clock oscillator and buffer.

Port 0, P02–P00. Port 0 is a 3-bit bidirectional, Schmitt-triggered CMOS-compatible I/O port. These three I/O lines can be globally configured under software control to be inputs or outputs (Figure 7).

Auto Latch. The Auto Latch puts valid CMOS levels on all CMOS inputs (except P33, P32, P31) that are not externally driven. A valid CMOS level, rather than a floating node, reduces excessive supply current flow in the input buffer. On Power-up and Reset, the Auto Latch will set the ports to an undetermined state of 0 or 1. Default condition is Auto Latches enabled.

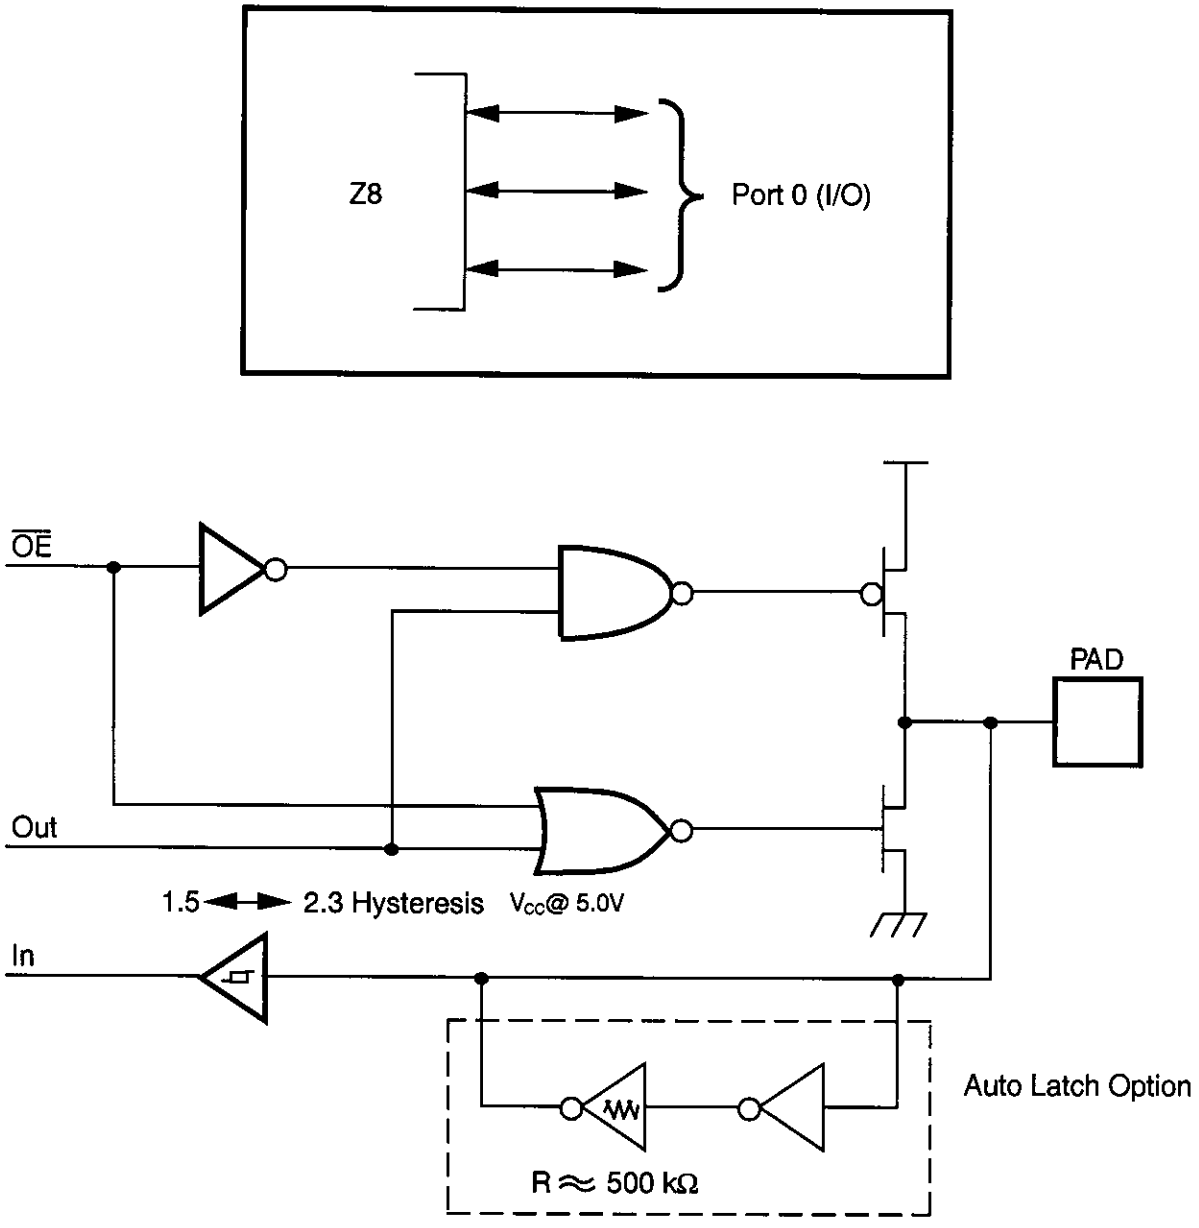

Figure 7. Port 0 Configuration

Comparator Inputs. Two analog comparators are added to input of Port 3, P31, and P32, for interface flexibility. The comparators reference voltage P33 (REF) is common to both comparators.

Typical applications for the on-board comparators; Zero crossing detection, A/D conversion, voltage scaling, and threshold detection. In Analog Mode, P33 input functions serve as a reference voltage to the comparators.

The dual comparator (common inverting terminal) features a single power supply which discontinues power in STOP Mode. The common voltage range is 0–4 V when the V_{CC} is 5.0V; the power supply and common mode rejection ratios are 90 dB and 60 dB, respectively.

Interrupts are generated on either edge of Comparator 2's output, or on the falling edge of Comparator 1's output. The comparator output is used for interrupt generation, Port 3 data inputs, or T_{IN} through P31. Alternatively, the comparators can be disabled, freeing the reference input (P33) for use as IRQ1 and/or P33 input.

FUNCTIONAL DESCRIPTION

The following special functions have been incorporated into the Z8 devices to enhance the standard Z8 core architecture to provide the user with increased design flexibility.

RESET. This function is accomplished by means of a Power-On Reset or a Watch-Dog Timer Reset. Upon power-up, the Power-On Reset circuit waits for T_{POR} ms, plus 18 clock cycles, then starts program execution at address 000C (Hex) (Figure 10). The Z8 control registers' reset value is shown in Table 3.

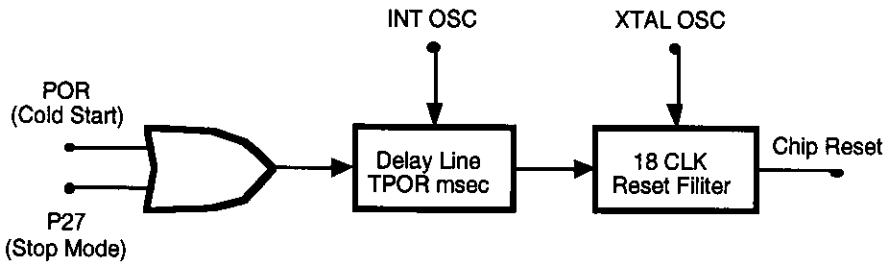

Figure 10. Internal Reset Configuration

Power-On Reset (POR). A timer circuit clocked by a dedicated on-board RC oscillator is used for a POR timer function. The POR time allows V_{CC} and the oscillator circuit to stabilize before instruction execution begins. The POR timer circuit is a one-shot timer triggered by one of the four following conditions:

- Power-bad to power-good status
- Stop-Mode Recovery
- WDT time-out
- WDH time-out

Watch-Dog Timer Reset. The WDT is a retriggerable one-shot timer that resets the Z8 if it reaches its terminal count. The WDT is initially enabled by executing the WDT instruction and is retriggered on subsequent execution of the WDT instruction. The timer circuit is driven by an on-board RC oscillator.

Program Memory. The Z86E04/E08 addresses up to 1K/2KB of Internal Program Memory (Figure 11). The first 12 bytes of program memory are reserved for the interrupt vectors. These locations contain six 16-bit vectors that correspond to the six available interrupts. Bytes 0–1024/2048 are on-chip one-time programmable ROM.

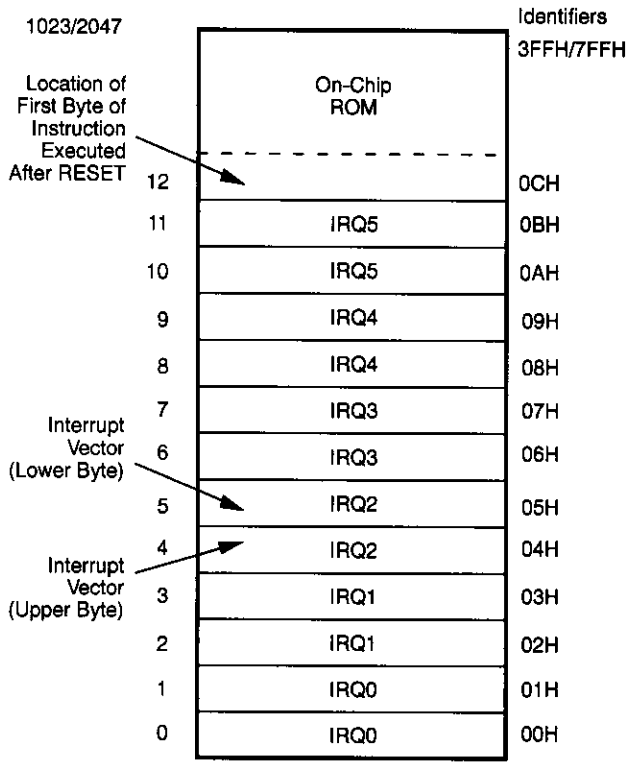

Figure 11. Program Memory Map

Register File. The Register File consists of three I/O port registers, 124 general-purpose registers, and 14 control and status registers R0–R3, R4–R127 and R241–R255, respectively (Figure 12). General-purpose registers occupy the 04H to 7FH address space. I/O ports are mapped as per the existing CMOS Z8.

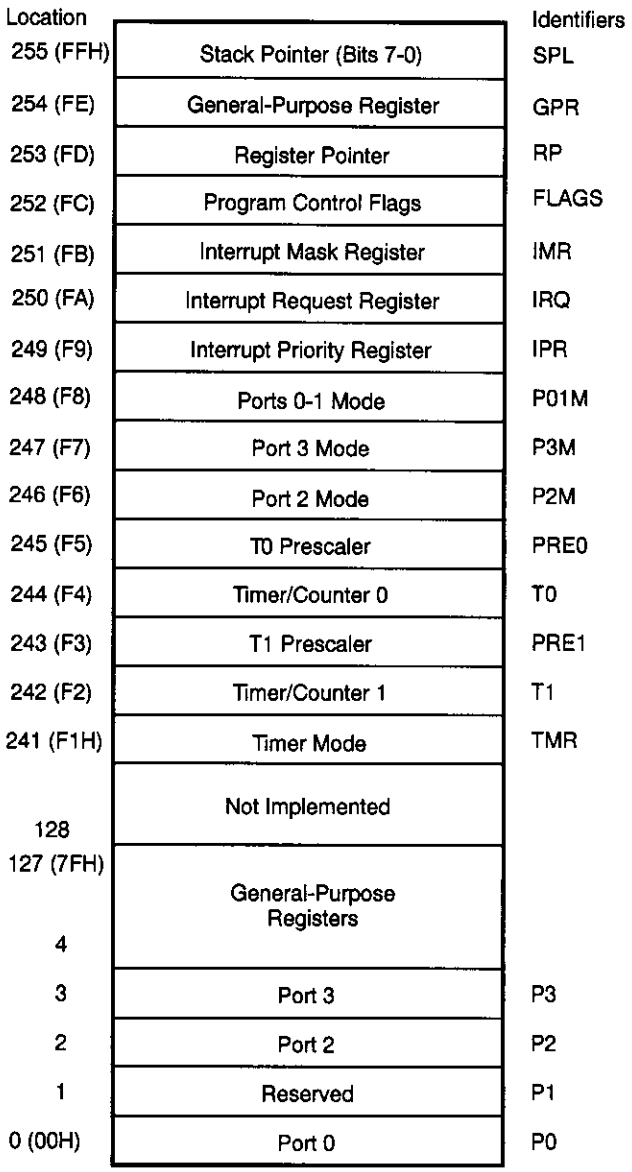

Figure 12. Register File
