What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	Z8
Core Size	8-Bit
Speed	12MHz
Connectivity	-
Peripherals	POR, WDT
Number of I/O	14
Program Memory Size	2KB (2K x 8)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	125 x 8
Voltage - Supply (Vcc/Vdd)	4.5V ~ 5.5V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	20-SSOP (0.209", 5.30mm Width)
Supplier Device Package	-

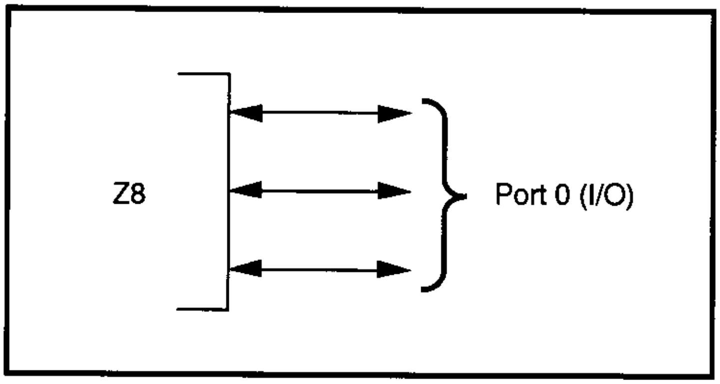
PIN FUNCTIONS (Continued)

XTAL1, XTAL2 *Crystal In, Crystal Out* (time-based input and output, respectively). These pins connect a parallel-resonant crystal, LC, or an external single-phase clock (8 MHz or 12 MHz max) to the on-chip clock oscillator and buffer.

Port 0, P02–P00. Port 0 is a 3-bit bidirectional, Schmitt-triggered CMOS-compatible I/O port. These three I/O lines can be globally configured under software control to be inputs or outputs (Figure 7).

Auto Latch. The Auto Latch puts valid CMOS levels on all CMOS inputs (except P33, P32, P31) that are not externally driven. A valid CMOS level, rather than a floating node, reduces excessive supply current flow in the input buffer. On Power-up and Reset, the Auto Latch will set the ports to an undetermined state of 0 or 1. Default condition is Auto Latches enabled.



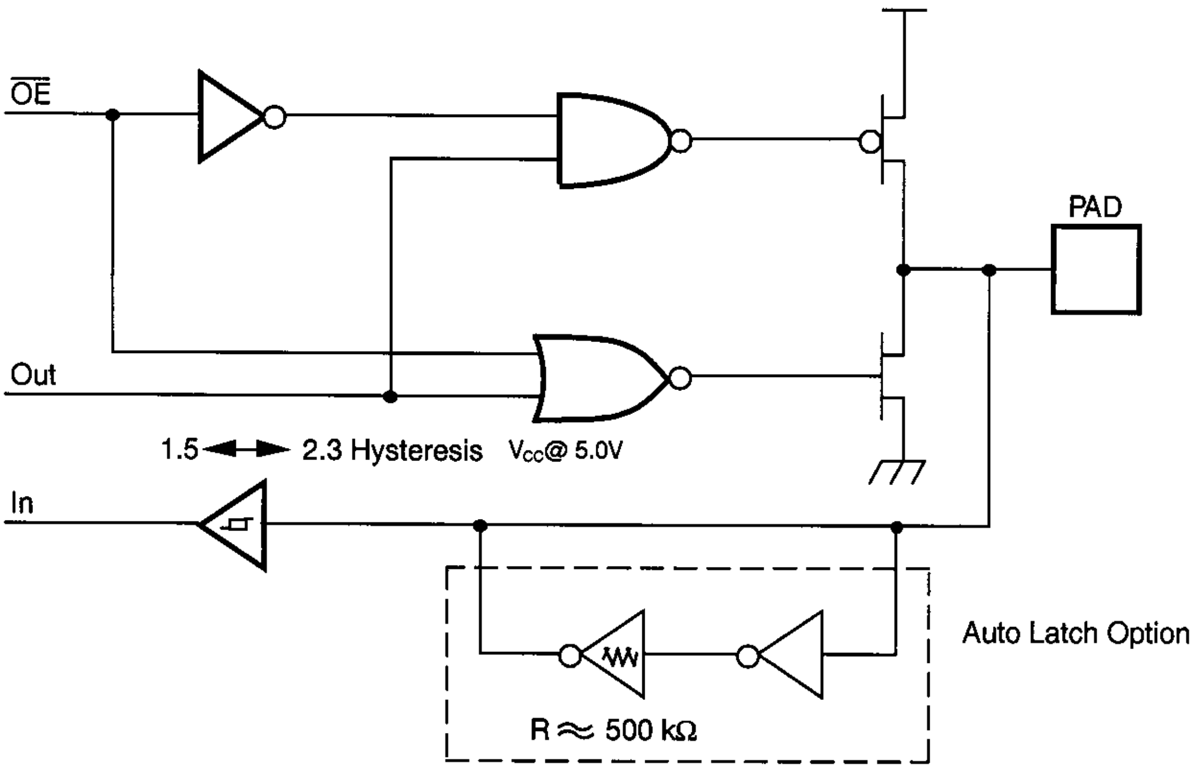


Figure 7. Port 0 Configuration

Port 2, P27–P20. Port 2 is an 8-bit, bit programmable, bi-directional, Schmitt-triggered CMOS-compatible I/O port. These eight I/O lines can be configured under software control to be inputs or outputs, independently. Bits programmed as outputs can be globally programmed as either push-pull or open-drain (Figure 8).

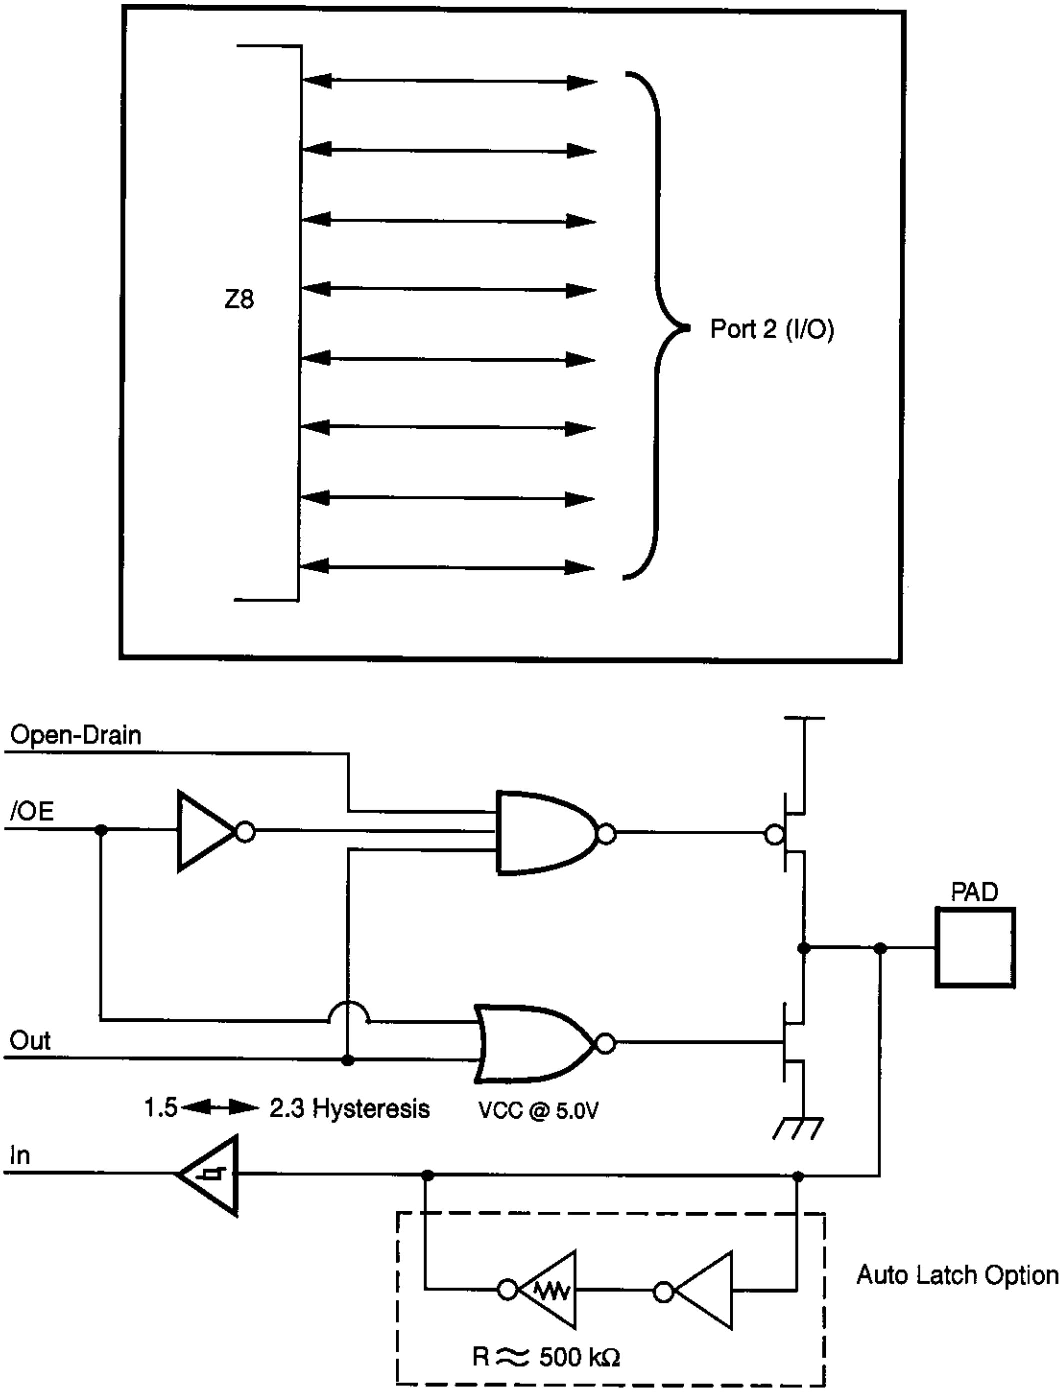

Figure 8. Port 2 Configuration

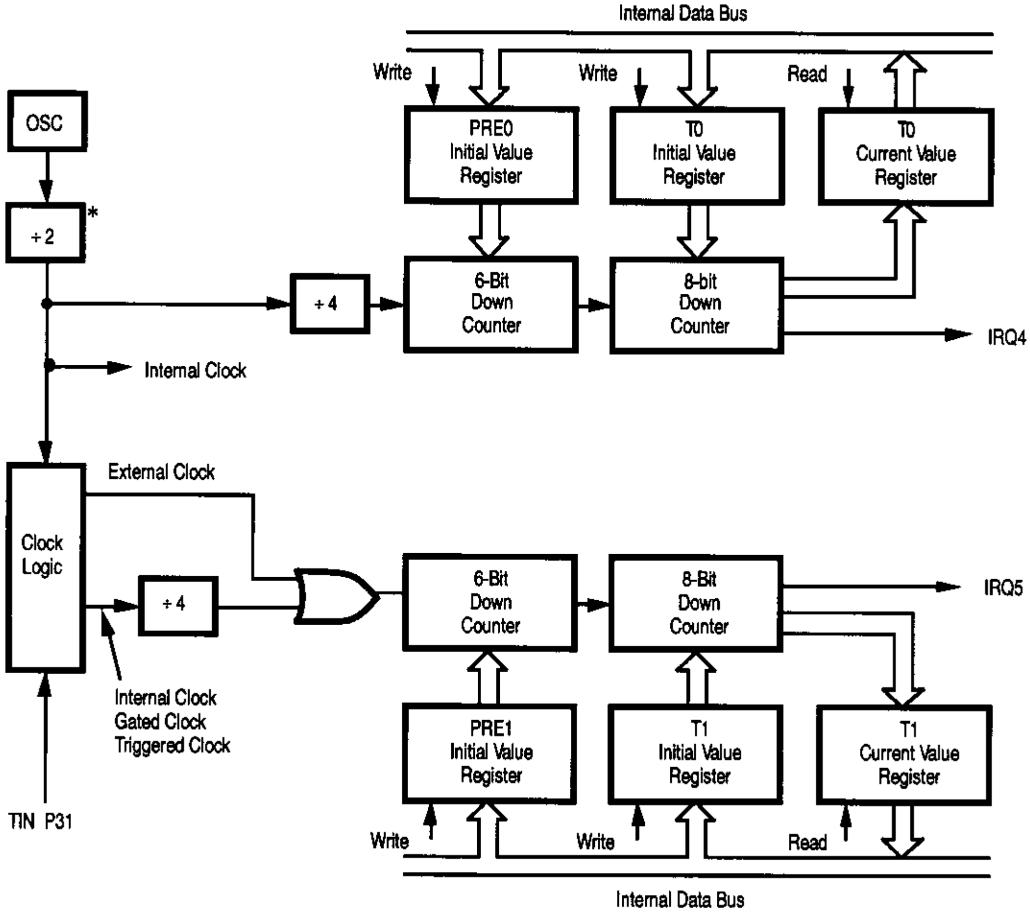

* **Note**: By passed, if Low EMI Mode is selected.

Figure 14. Counter/Timers Block Diagram

Clock. The Z8 on-chip oscillator has a high-gain, parallel-resonant amplifier for connection to a crystal, LC, RC, ceramic resonator, or any suitable external clock source (XTAL1 = INPUT, XTAL2 = OUTPUT). The crystal should be AT cut, up to 12 MHz max., with a series resistance (RS) of less than or equal to 100 Ohms.

The crystal should be connected across XTAL1 and XTAL2 using the vendors crystal recommended capacitors from each pin directly to device ground pin 14 (Figure 16). Note that the crystal capacitor loads should be connected to V_{SS}, Pin 14 to reduce Ground noise injection.

Notes:
A = STD Mode Frequency.
B = Low EMI Mode Frequency.

HALT Mode. This instruction turns off the internal CPU clock but not the crystal oscillation. The counter/timers and external interrupts IRQ0, IRQ1, IRQ2 and IRQ3 remain active. The device is recovered by interrupts, either externally or internally generated. An interrupt request must be executed (enabled) to exit HALT Mode. After the interrupt service routine, the program continues from the instruction after the HALT.

Note: On the C12 ICEBOX, the IRQ3 does not wake the device out of HALT Mode.

STOP Mode. This instruction turns off the internal clock and external crystal oscillation and reduces the standby current to 10 µA. The STOP Mode is released by a RESET through a Stop-Mode Recovery (pin P27). A Low input condition on P27 releases the STOP Mode. Program execution begins at location 000C(Hex). However, when P27 is used to release the STOP Mode, the I/O port Mode registers are not reconfigured to their default power-on conditions. This prevents any I/O, configured as output when the STOP instruction was executed, from glitching to an unknown state. To use the P27 release approach with STOP Mode, use the following instruction:

```
LD          P2M, #1XXX XXXXB
NOP
STOP
     X = Dependent on user's application.
```

Note: A low level detected on P27 pin will take the device out of STOP Mode even if configured as an output.

In order to enter STOP or HALT Mode, it is necessary to first flush the instruction pipeline to avoid suspending execution in mid-instruction. To do this, the user executes a NOP (opcode=FFH) immediately before the appropriate SLEEP instruction, such as:

```
FF    NOP     ; clear the pipeline
6F    STOP    ; enter STOP Mode
        or
FF    NOP     ; clear the pipeline
7F    HALT    ; enter HALT Mode
```

Watch-Dog Timer (WDT). The Watch-Dog Timer is enabled by instruction WDT. When the WDT is enabled, it cannot be stopped by the instruction. With the WDT instruction, the WDT is refreshed when it is enabled within every 1 Twdt period; otherwise, the controller resets itself, The WDT instruction affects the flags accordingly; Z=1, S=0, V=0.

WDT = 5F (Hex)

Opcode WDT (5FH). The first time Opcode 5FH is executed, the WDT is enabled and subsequent execution clears the WDT counter. This must be done at least every T_{WDT}; otherwise, the WDT times out and generates a reset. The generated reset is the same as a power-on reset of T_{POR}, plus 18 XTAL clock cycles. The software enabled WDT does not run in STOP Mode.

Opcode WDH (4FH). When this instruction is executed it enables the WDT during HALT. If not, the WDT stops when entering HALT. This instruction does not clear the counters, it just makes it possible to have the WDT running during HALT Mode. A WDH instruction executed without executing WDT (5FH) has no effect.

Permanent WDT. Selecting the hardware enabled Permanent WDT option, will automatically enable the WDT upon exiting reset. The permanent WDT will always run in HALT Mode and STOP Mode, and it cannot be disabled.

Auto Reset Voltage (V_{LV}). The Z8 has an auto-reset built-in. The auto-reset circuit resets the Z8 when it detects the V_{CC} below V_{LV}.

Figure 17 shows the Auto Reset Voltage versus temperature. If the V_{CC} drops below the VCC operating voltage range, the Z8 will function down to the V_{LV} unless the internal clock frequency is higher than the specified maximum V_{LV} frequency.

Pre-Characterization Product:

The product represented by this CPS is newly introduced and Zilog has not completed the full characterization of the product. The CPS states what Zilog knows about this product at this time, but additional features or nonconformance with some aspects of the CPS may be found, either by Zilog or its customers in the course of further application and characterization work. In addition, Zilog cautions that delivery may be uncertain at times, due to start-up yield issues.
