Zilog - Z86E0812HSC1866 Datasheet

Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	Z8
Core Size	8-Bit
Speed	12MHz
Connectivity	-
Peripherals	POR, WDT
Number of I/O	14
Program Memory Size	2KB (2K x 8)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	125 x 8
Voltage - Supply (Vcc/Vdd)	4.5V ~ 5.5V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	20-SOIC (0.295", 7.50mm Width)
Supplier Device Package	-
Purchase URL	https://www.e-xfl.com/product-detail/zilog/z86e0812hsc1866

FEATURES

- 14 Input/Output Lines
- Six Vectored, Prioritized Interrupts (3 falling edge, 1 rising edge, 2 timers)
- Two Analog Comparators
- Program Options:
  - Low Noise
  - ROM Protect
  - Auto Latch
  - Watch-Dog Timer (WDT)
  - EPROM/Test Mode Disable
- Two Programmable 8-Bit Counter/Timers, Each with 6-Bit Programmable Prescaler
- WDT/ Power-On Reset (POR)
- On-Chip Oscillator that Accepts XTAL, Ceramic Resonance, LC, RC, or External Clock
- Clock-Free WDT Reset
- Low-Power Consumption (50 mw typical)
- Fast Instruction Pointer (1µs @ 12 MHz)
- RAM Bytes (125)

GENERAL DESCRIPTION

Zilog's Z86E04/E08 Microcontrollers (MCU) are One-Time Programmable (OTP) members of Zilog's single-chip Z8® MCU family that allow easy software development, debug, prototyping, and small production runs not economically desirable with masked ROM versions.

For applications demanding powerful I/O capabilities, the Z86E04/E08's dedicated input and output lines are grouped into three ports, and are configurable under software control to provide timing, status signals, or parallel I/O.

Two on-chip counter/timers, with a large number of user selectable modes, offload the system of administering real-time tasks such as counting/timing and I/O data communications.

Note: All Signals with an overline, " ‾ ", are active Low, for example: B/$\overline{W}$ (WORD is active Low); $\overline{B}$/W (BYTE is active Low, only).

Power connections follow conventional descriptions below:

Connection	Circuit	Device
Power	V_{CC}	V_{DD}
Ground	GND	V_{SS}

STANDARD TEST CONDITIONS

The characteristics listed below apply for standard test conditions as noted. All voltages are referenced to Ground. Positive current flows into the referenced pin (Figure 5).

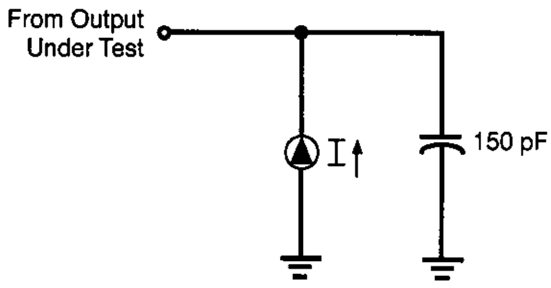

Figure 5. Test Load Diagram

CAPACITANCE

T_A = 25°C, V_{CC} = GND = 0V, f = 1.0 MHz, unmeasured pins returned to GND.

Parameter	Min	Max
Input capacitance	0	10 pF
Output capacitance	0	20 pF
I/O capacitance	0	25 pF

2. Interrupt request through Port 3 (P33–P31).

LOW NOISE VERSION

Low EMI Emission

The Z86E04/E08 can be programmed to operate in a Low EMI Emission Mode by means of a mask ROM bit option. Use of this feature results in:

- All pre-driver slew rates reduced to 10 ns typical.
- Internal SCLK/TCLK operation limited to a maximum of 4 MHz–250 ns cycle time.
- Output drivers have resistances of 500 Ohms (typical).
- Oscillator divide-by-two circuitry eliminated.

The Low EMI Mode is mask-programmable to be selected by the customer at the time the ROM code is submitted.

PIN FUNCTIONS

OTP Programming Mode

D7–D0 *Data Bus.* Data can be read from, or written to, the EPROM through this data bus.

V_{CC} *Power Supply.* It is typically 5V during EPROM Read Mode and 6.4V during the other modes (Program, Program Verify, and so on).

$\overline{CE}$ *Chip Enable* (active Low). This pin is active during EPROM Read Mode, Program Mode, and Program Verify Mode.

$\overline{OE}$ *Output Enable* (active Low). This pin drives the Data Bus direction. When this pin is Low, the Data Bus is output. When High, the Data Bus is input.

EPM *EPROM Program Mode.* This pin controls the different EPROM Program Modes by applying different voltages.

V_{PP} *Program Voltage.* This pin supplies the program voltage.

Clear *Clear* (active High). This pin resets the internal address counter at the High Level.

Clock *Address Clock.* This pin is a clock input. The internal address counter increases by one with one clock cycle.

$\overline{PGM}$ *Program Mode* (active Low). A Low level at this pin programs the data to the EPROM through the Data Bus.

Application Precaution

The production test-mode environment may be enabled accidentally during normal operation if ***excessive noise*** surges above V_{CC} occur on the XTAL1 pin.

In addition, processor operation of Z8 OTP devices may be affected by ***excessive noise*** surges on the V_{PP}, $\overline{CE}$, EPM, $\overline{OE}$ pins while the microcontroller is in Standard Mode.

Recommendations for dampening voltage surges in both test and OTP Mode include the following:

- Using a clamping diode to V_{CC}.
- Adding a capacitor to the affected pin.

Note: Programming the EPROM/Test Mode Disable option will prevent accidental entry into EPROM Mode or Test Mode.

Port 2, P27–P20. Port 2 is an 8-bit, bit programmable, bidirectional, Schmitt-triggered CMOS-compatible I/O port. These eight I/O lines can be configured under software control to be inputs or outputs, independently. Bits programmed as outputs can be globally programmed as either push-pull or open-drain (Figure 8).

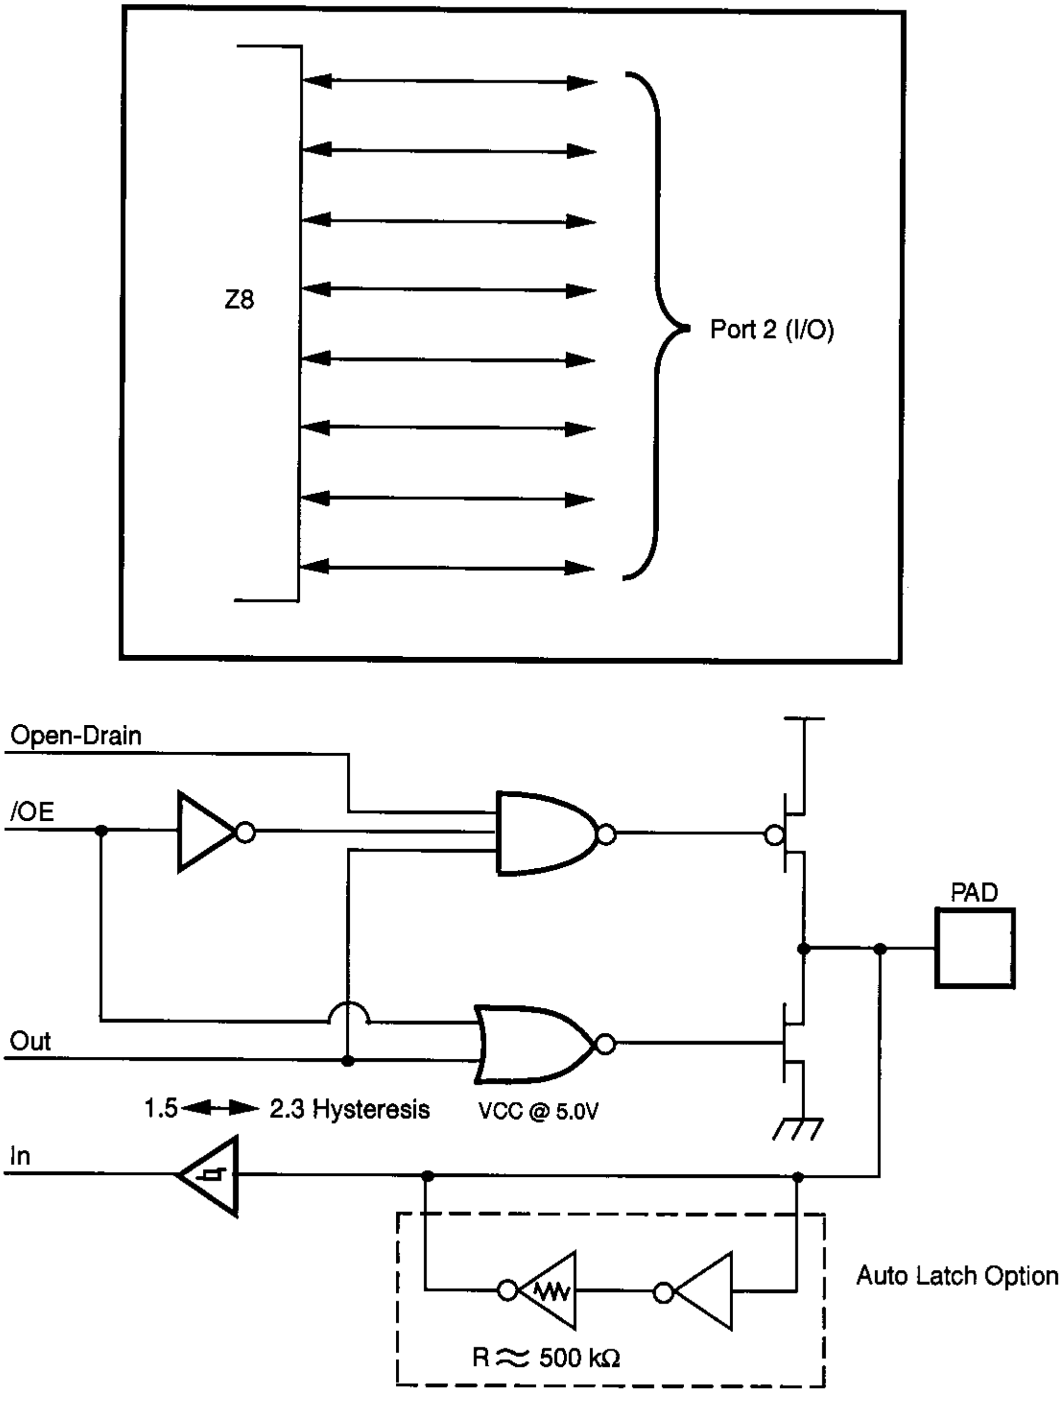

Figure 8. Port 2 Configuration

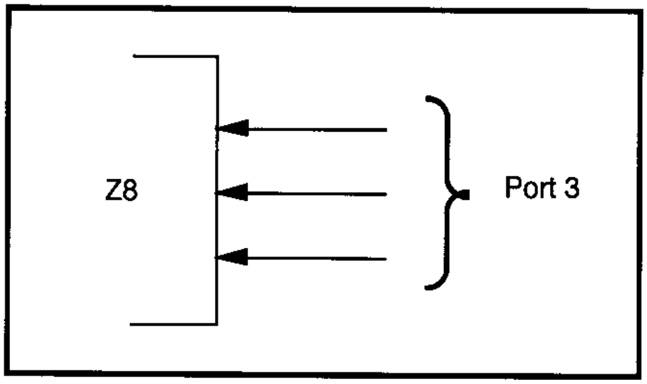
PIN FUNCTIONS (Continued)

Port 3, P33–P31. Port 3 is a 3-bit, CMOS-compatible port with three fixed input (P33–P31) lines. These three input lines can be configured under software control as digital Schmitt-trigger inputs or analog inputs.

These three input lines are also used as the interrupt sources IRQ0–IRQ3, and as the timer input signal T_{IN} (Figure 9).



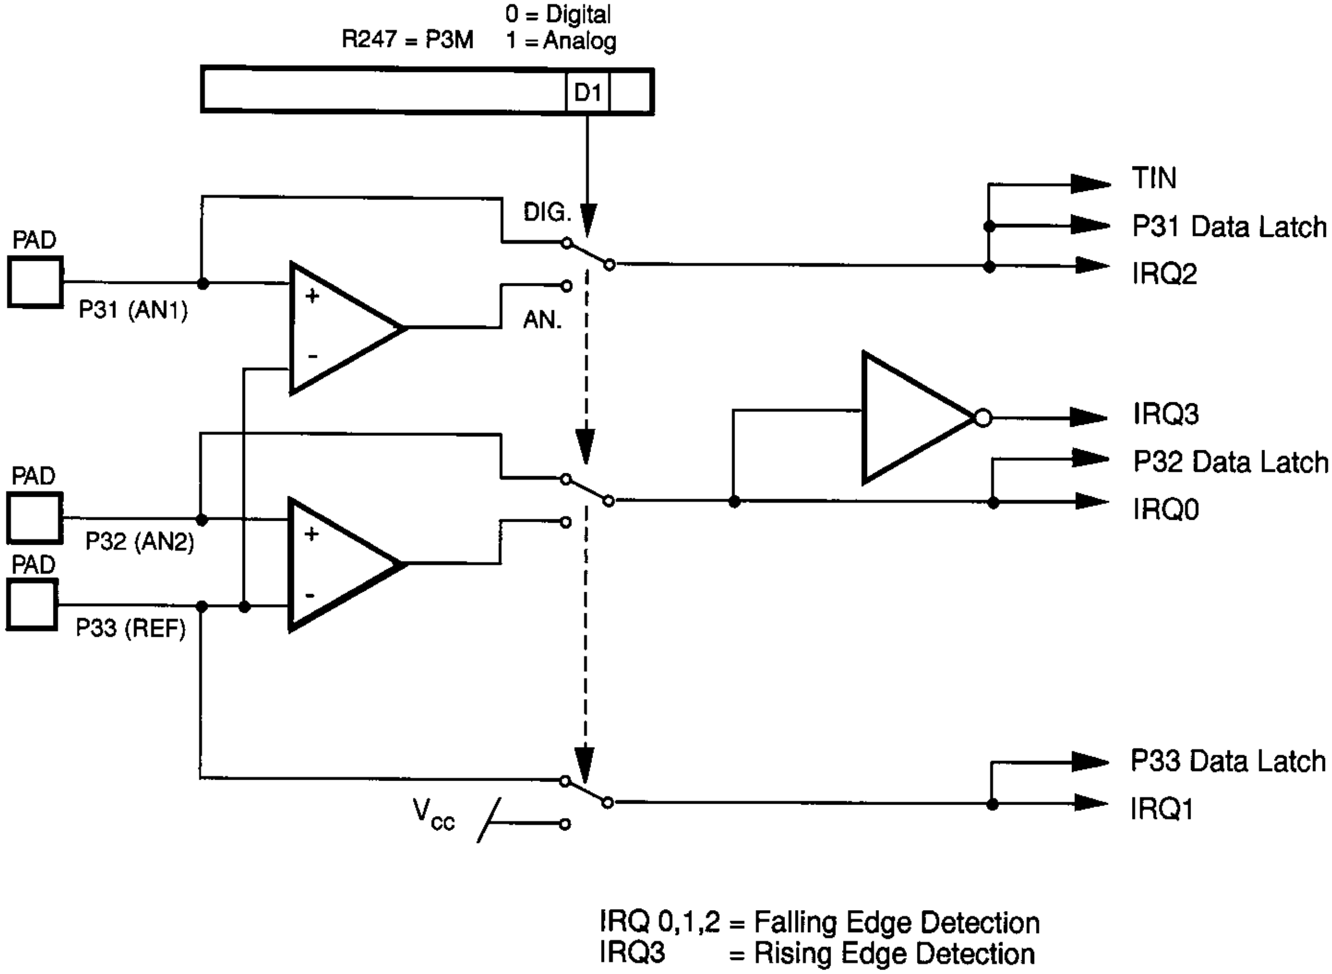


Figure 9. Port 3 Configuration

Comparator Inputs. Two analog comparators are added to input of Port 3, P31, and P32, for interface flexibility. The comparators reference voltage P33 (REF) is common to both comparators.

Typical applications for the on-board comparators; Zero crossing detection, A/D conversion, voltage scaling, and threshold detection. In Analog Mode, P33 input functions serve as a reference voltage to the comparators.

The dual comparator (common inverting terminal) features a single power supply which discontinues power in STOP Mode. The common voltage range is 0–4 V when the V_{CC} is 5.0V; the power supply and common mode rejection ratios are 90 dB and 60 dB, respectively.

Interrupts are generated on either edge of Comparator 2's output, or on the falling edge of Comparator 1's output. The comparator output is used for interrupt generation, Port 3 data inputs, or T_{IN} through P31. Alternatively, the comparators can be disabled, freeing the reference input (P33) for use as IRQ1 and/or P33 input.

FUNCTIONAL DESCRIPTION

The following special functions have been incorporated into the Z8 devices to enhance the standard Z8 core architecture to provide the user with increased design flexibility.

RESET. This function is accomplished by means of a Power-On Reset or a Watch-Dog Timer Reset. Upon power-up, the Power-On Reset circuit waits for T_{POR} ms, plus 18 clock cycles, then starts program execution at address 000C (Hex) (Figure 10). The Z8 control registers' reset value is shown in Table 3.

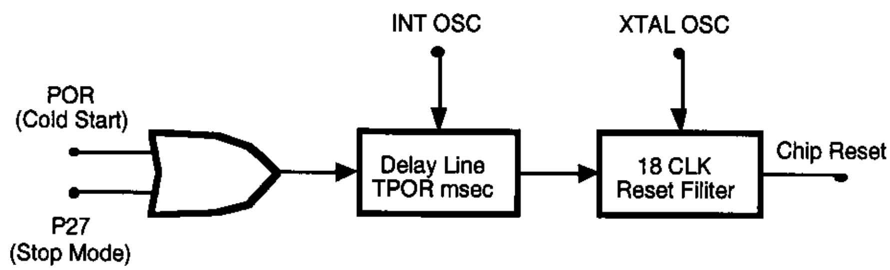

Figure 10. Internal Reset Configuration

Power-On Reset (POR). A timer circuit clocked by a dedicated on-board RC oscillator is used for a POR timer function. The POR time allows V_{CC} and the oscillator circuit to stabilize before instruction execution begins. The POR timer circuit is a one-shot timer triggered by one of the four following conditions:

- Power-bad to power-good status
- Stop-Mode Recovery
- WDT time-out
- WDH time-out

Watch-Dog Timer Reset. The WDT is a retriggerable one-shot timer that resets the Z8 if it reaches its terminal count. The WDT is initially enabled by executing the WDT instruction and is retriggered on subsequent execution of the WDT instruction. The timer circuit is driven by an on-board RC oscillator.

Program Memory. The Z86E04/E08 addresses up to 1K/2KB of Internal Program Memory (Figure 11). The first 12 bytes of program memory are reserved for the interrupt vectors. These locations contain six 16-bit vectors that correspond to the six available interrupts. Bytes 0–1024/2048 are on-chip one-time programmable ROM.

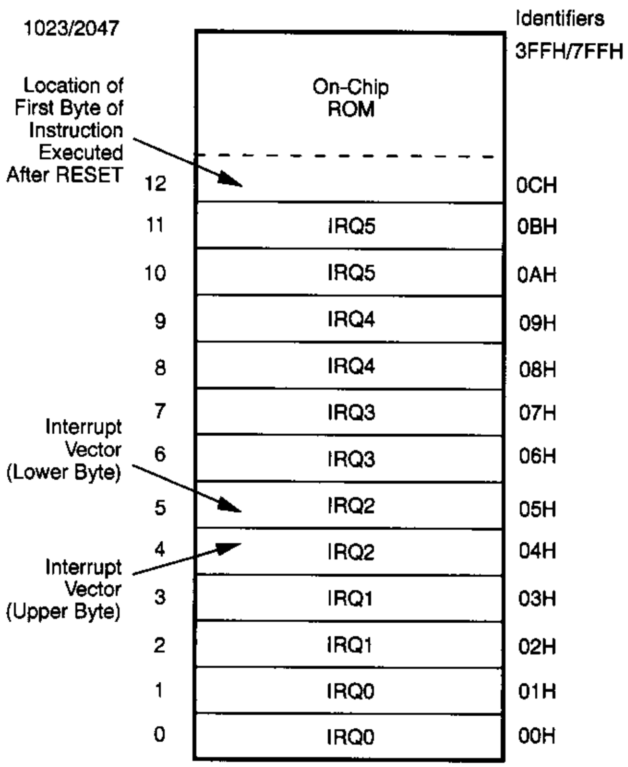

Figure 11. Program Memory Map

Register File. The Register File consists of three I/O port registers, 124 general-purpose registers, and 14 control and status registers R0–R3, R4–R127 and R241–R255, respectively (Figure 12). General-purpose registers occupy the 04H to 7FH address space. I/O ports are mapped as per the existing CMOS Z8.

Location	Register	Identifiers
255 (FFH)	Stack Pointer (Bits 7-0)	SPL

1K	7M	4.6M	5M	3.6M	3.6K	2.6M	660K	565K

Notes:
A = STD Mode Frequency.
B = Low EMI Mode Frequency.

HALT Mode. This instruction turns off the internal CPU clock but not the crystal oscillation. The counter/timers and external interrupts IRQ0, IRQ1, IRQ2 and IRQ3 remain active. The device is recovered by interrupts, either externally or internally generated. An interrupt request must be executed (enabled) to exit HALT Mode. After the interrupt service routine, the program continues from the instruction after the HALT.

Note: On the C12 ICEBOX, the IRQ3 does not wake the device out of HALT Mode.

STOP Mode. This instruction turns off the internal clock and external crystal oscillation and reduces the standby current to 10 μA. The STOP Mode is released by a RESET through a Stop-Mode Recovery (pin P27). A Low input condition on P27 releases the STOP Mode. Program execution begins at location 000C(Hex). However, when P27 is used to release the STOP Mode, the I/O port Mode registers are not reconfigured to their default power-on conditions. This prevents any I/O, configured as output when the STOP instruction was executed, from glitching to an unknown state. To use the P27 release approach with STOP Mode, use the following instruction:

```
LD          P2M, #1XXX XXXXB
NOP
STOP
     X = Dependent on user's application.
```

Note: A low level detected on P27 pin will take the device out of STOP Mode even if configured as an output.

In order to enter STOP or HALT Mode, it is necessary to first flush the instruction pipeline to avoid suspending execution in mid-instruction. To do this, the user executes a NOP (opcode=FFH) immediately before the appropriate SLEEP instruction, such as:

```
FF    NOP     ; clear the pipeline
6F    STOP    ; enter STOP Mode
        or
FF    NOP     ; clear the pipeline
7F    HALT    ; enter HALT Mode
```

Watch-Dog Timer (WDT). The Watch-Dog Timer is enabled by instruction WDT. When the WDT is enabled, it cannot be stopped by the instruction. With the WDT instruction, the WDT is refreshed when it is enabled within every 1 Twdt period; otherwise, the controller resets itself, The WDT instruction affects the flags accordingly; Z=1, S=0, V=0.

WDT = 5F (Hex)

Opcode WDT (5FH). The first time Opcode 5FH is executed, the WDT is enabled and subsequent execution clears the WDT counter. This must be done at least every T_{WDT}; otherwise, the WDT times out and generates a reset. The generated reset is the same as a power-on reset of T_{POR}, plus 18 XTAL clock cycles. The software enabled WDT does not run in STOP Mode.

Opcode WDH (4FH). When this instruction is executed it enables the WDT during HALT. If not, the WDT stops when entering HALT. This instruction does not clear the counters, it just makes it possible to have the WDT running during HALT Mode. A WDH instruction executed without executing WDT (5FH) has no effect.

Permanent WDT. Selecting the hardware enabled Permanent WDT option, will automatically enable the WDT upon exiting reset. The permanent WDT will always run in HALT Mode and STOP Mode, and it cannot be disabled.

Auto Reset Voltage (V_{LV}). The Z8 has an auto-reset built-in. The auto-reset circuit resets the Z8 when it detects the V_{CC} below V_{LV}.

Figure 17 shows the Auto Reset Voltage versus temperature. If the V_{CC} drops below the VCC operating voltage range, the Z8 will function down to the V_{LV} unless the internal clock frequency is higher than the specified maximum V_{LV} frequency.

FUNCTIONAL DESCRIPTION (Continued)

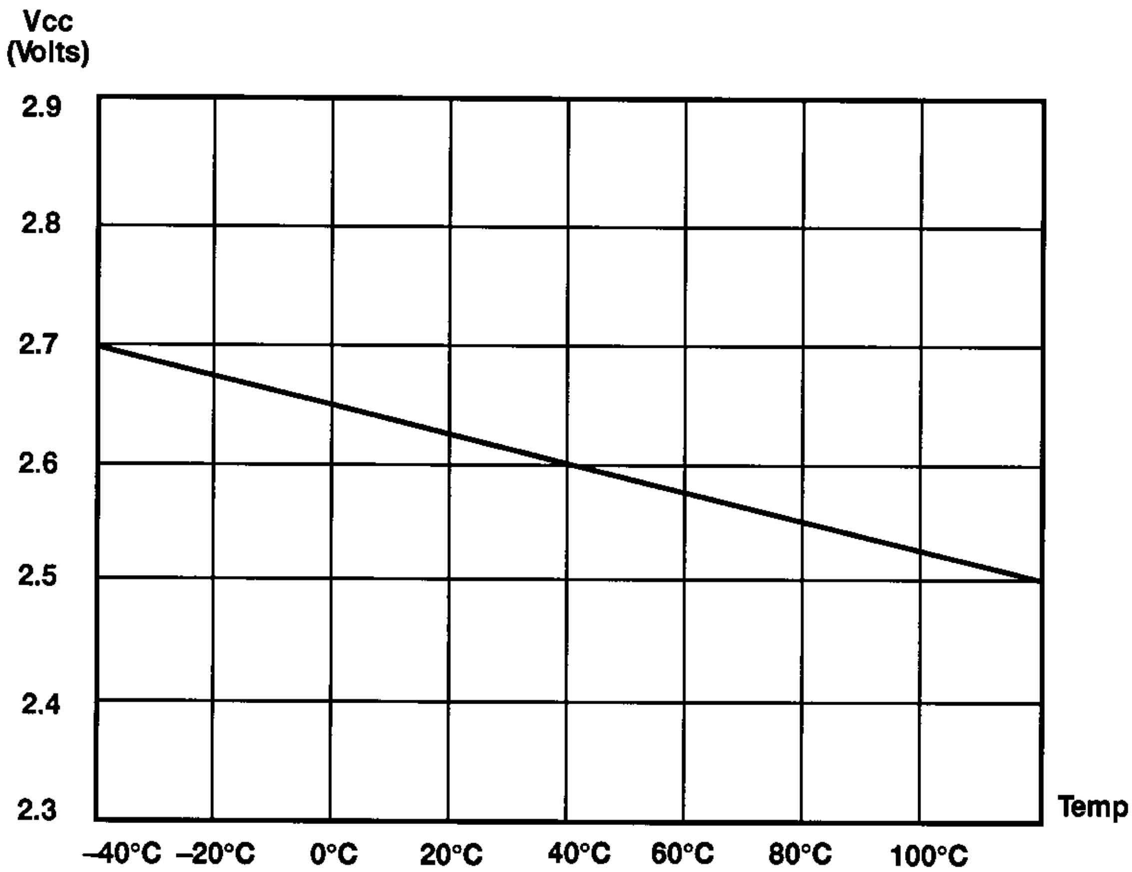

Figure 17. Typical Auto Reset Voltage (V_{LV}) vs. Temperature

Low EMI Emission

The Z8 can be programmed to operate in a low EMI Emission (Low Noise) Mode by means of an EPROM programmable bit option. Use of this feature results in:

- Less than 1 mA consumed during HALT Mode.
- All drivers slew rates reduced to 10 ns (typical).
- Internal SCLK/TCLK = XTAL operation limited to a maximum of 4 MHz–250 ns cycle time.
- Output drivers have resistances of 500 ohms (typical).
- Oscillator divide-by-two circuitry eliminated.

In addition to V_{DD} and GND (V_{SS}), the Z8 changes all its pin functions in the EPROM Mode. XTAL2 has no function, XTAL1 functions as $\overline{CE}$, P31 functions as $\overline{OE}$, P32 functions as EPM, P33 functions as V_{PP}, and P02 functions as $\overline{PGM}$.

ROM Protect. ROM Protect fully protects the Z8 ROM code from being read externally. When ROM Protect is selected, the instructions LDC and LDCI **are supported** (Z86E04/E08 and Z86C04/C08 do not support the instructions of LDE and LDEI). When the device is programmed for ROM Protect, the Low Noise feature will not automatically be enabled.

Please note that when using the device in a noisy environment, it is suggested that the voltages on the EPM and $\overline{CE}$ pins be clamped to V_{CC} through a diode to V_{CC} to prevent accidentally entering the OTP Mode. The V_{PP} requires both a diode and a 100 pF capacitor.

Auto Latch Disable. Auto Latch Disable option bit when programmed will globally disable all Auto Latches.

WDT Enable. The WDT Enable option bit, when programmed, will have the hardware enabled Permanent WDT enabled after exiting reset and can not be stopped in Halt or Stop Mode.

EPROM/Test Mode Disable. The EPROM/Test Mode Disable option bit, when programmed, will disable the EPROM Mode and the Factory Test Mode. Reading, verifying, and programming the Z8 will be disabled. To fully verify that this mode is disabled, the device must be power cycled.

User Modes. Table 7 shows the programming voltage of each mode.

Table 7. OTP Programming Table

Programming Modes	V_{PP}	EPM	$\overline{CE}$	$\overline{OE}$	$\overline{PGM}$	ADDR	DATA	V_{CC}*
EPROM READ	NU	V_H	V_{IL}	V_{IL}	V_{IH}	ADDR	Out	5.0V
PROGRAM	V_H	V_{IH}	V_{IL}	V_{IH}	V_{IL}	ADDR	In	6.4V
PROGRAM VERIFY	V_H	V_{IH}	V_{IL}	V_{IL}	V_{IH}	ADDR	Out	6.4V
EPROM PROTECT	V_H	V_H	V_H	V_{IH}	V_{IL}	NU	NU	6.4V
LOW NOISE SELECT	V_H	V_{IH}	V_H	V_{IH}	V_{IL}	NU	NU	6.4V
AUTO LATCH DISABLE	V_H	V_{IH}	V_H	V_{IL}	V_{IL}	NU	NU	6.4V
WDT ENABLE	V_H	V_{IL}	V_H	V_{IH}	V_{IL}	NU	NU	6.4V
EPROM/TEST MODE	V_H	V_{IL}	V_H	V_{IL}	V_{IL}	NU	NU	6.4V

Notes:

1. V_H =12.75V ± 0.25 V_{DC}.
2. V_{IH} = As per specific Z8 DC specification.
3. V_{IL} = As per specific Z8 DC specification.
4. X = Not used, but must be set to V_H or V_{IH} level.
5. NU = Not used, but must be set to either V_{IH} or V_{IL} level.
6. I_{PP} during programming = 40 mA maximum.
7. I_{CC} during programming, verify, or read = 40 mA maximum.
8. * V_{CC} has a tolerance of ±0.25V.
