
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	Z8
Core Size	8-Bit
Speed	12MHz
Connectivity	-
Peripherals	POR, WDT
Number of I/O	14
Program Memory Size	2KB (2K x 8)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	125 x 8
Voltage - Supply (Vcc/Vdd)	4.5V ~ 5.5V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	18-SOIC (0.295", 7.50mm Width)
Supplier Device Package	-
Purchase URL	https://www.e-xfl.com/product-detail/zilog/z86e0812sec1903

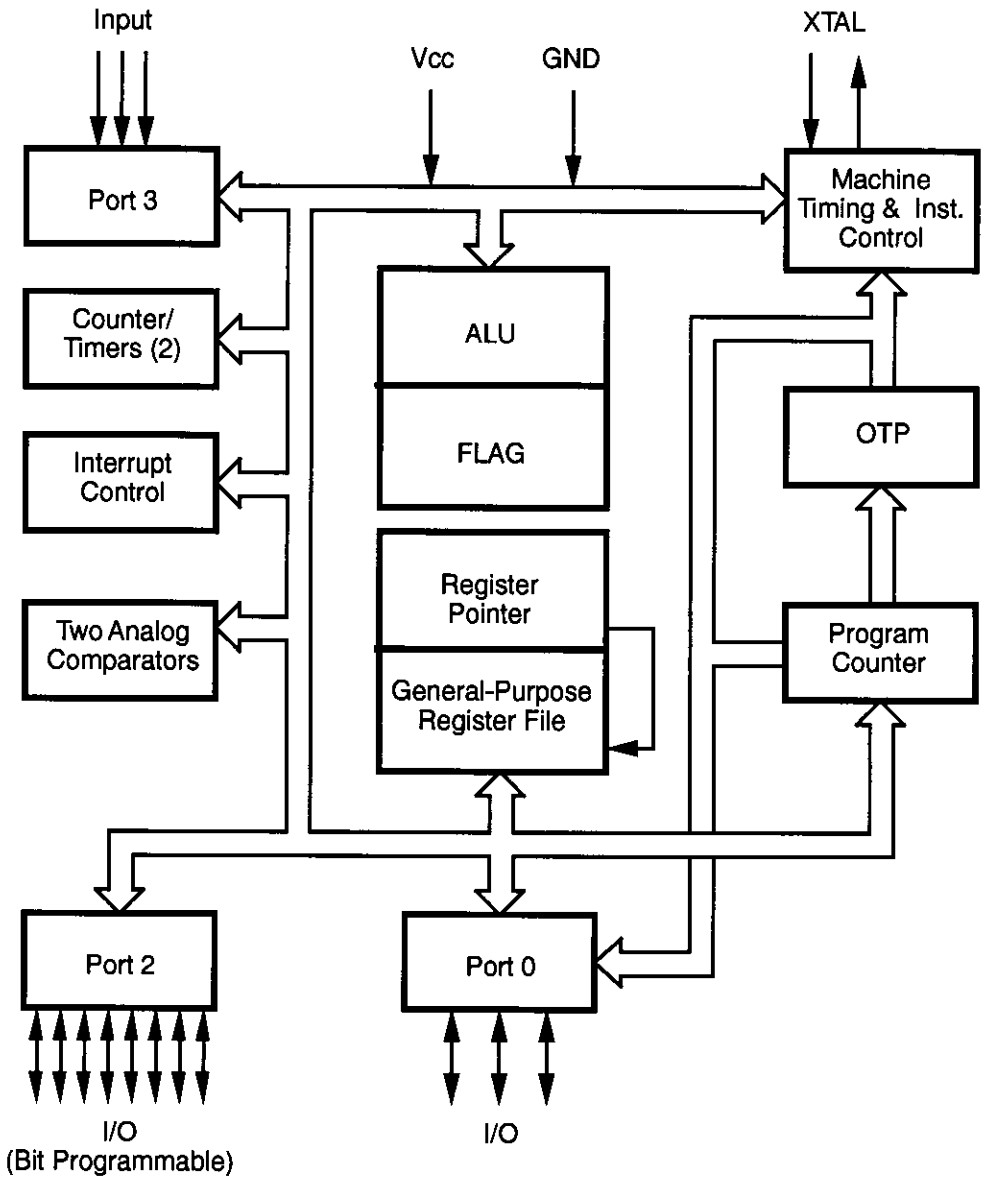

Figure 1. Functional Block Diagram

GENERAL DESCRIPTION (Continued)

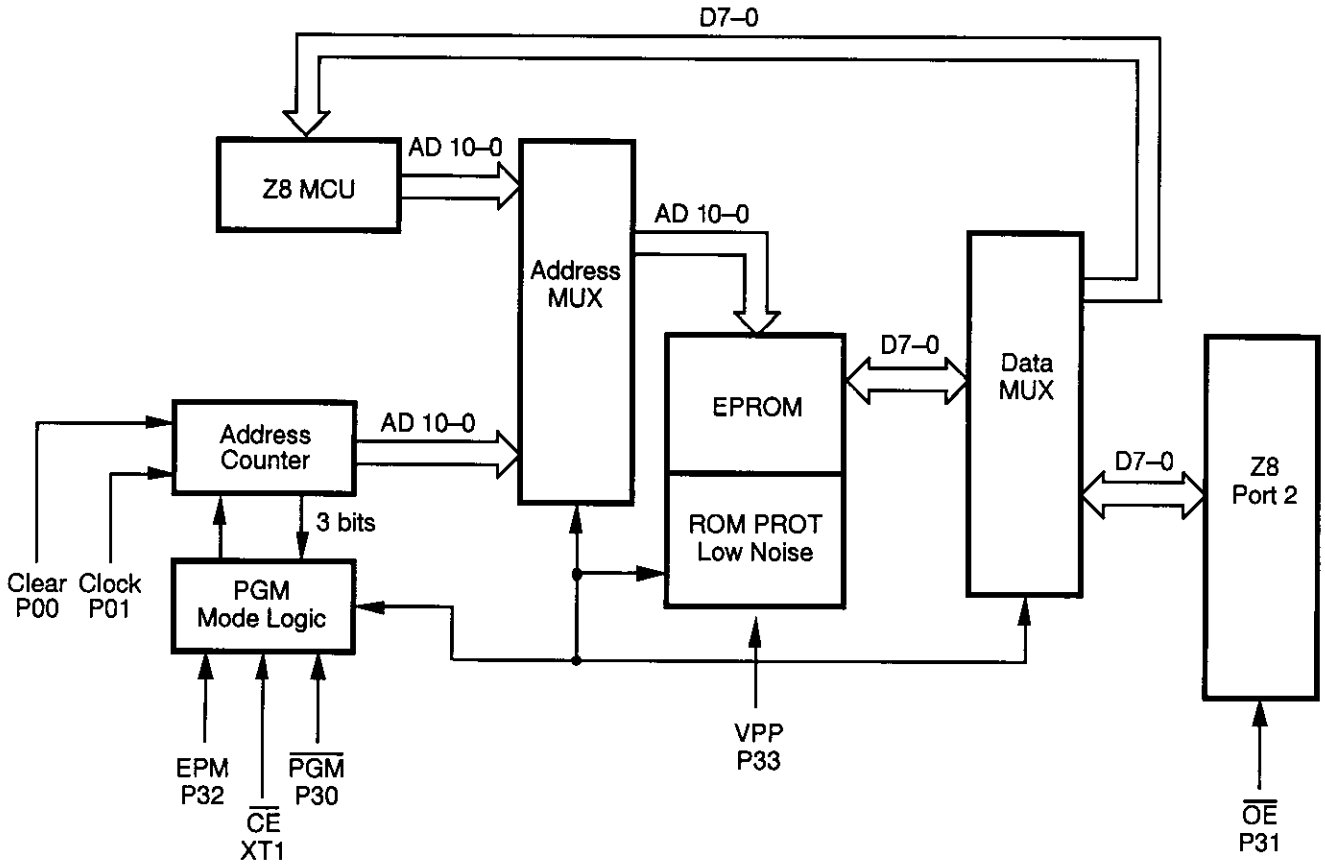

Figure 2. EPROM Programming Mode Block Diagram

STANDARD TEST CONDITIONS

The characteristics listed below apply for standard test conditions as noted. All voltages are referenced to Ground. Positive current flows into the referenced pin (Figure 5).

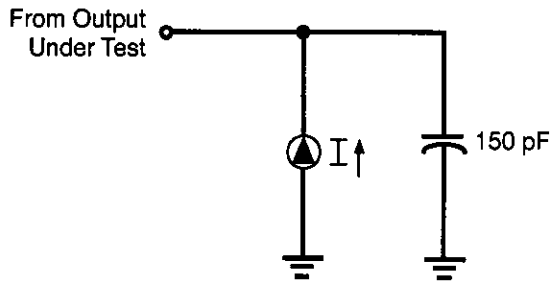

Figure 5. Test Load Diagram

CAPACITANCE

T_A = 25°C, V_{CC} = GND = 0V, f = 1.0 MHz, unmeasured pins returned to GND.

Parameter	Min	Max
Input capacitance	0	10 pF
Output capacitance	0	20 pF
I/O capacitance	0	25 pF

Notes:

1. Timing Reference uses 0.7 V_{CC} for a logic 1 and 0.2 V_{CC} for a logic 0.
2. Interrupt request through Port 3 (P33–P31).

PIN FUNCTIONS (Continued)

XTAL1, XTAL2 *Crystal In, Crystal Out* (time-based input and output, respectively). These pins connect a parallel-resonant crystal, LC, or an external single-phase clock (8 MHz or 12 MHz max) to the on-chip clock oscillator and buffer.

Port 0, P02–P00. Port 0 is a 3-bit bidirectional, Schmitt-triggered CMOS-compatible I/O port. These three I/O lines can be globally configured under software control to be inputs or outputs (Figure 7).

Auto Latch. The Auto Latch puts valid CMOS levels on all CMOS inputs (except P33, P32, P31) that are not externally driven. A valid CMOS level, rather than a floating node, reduces excessive supply current flow in the input buffer. On Power-up and Reset, the Auto Latch will set the ports to an undetermined state of 0 or 1. Default condition is Auto Latches enabled.

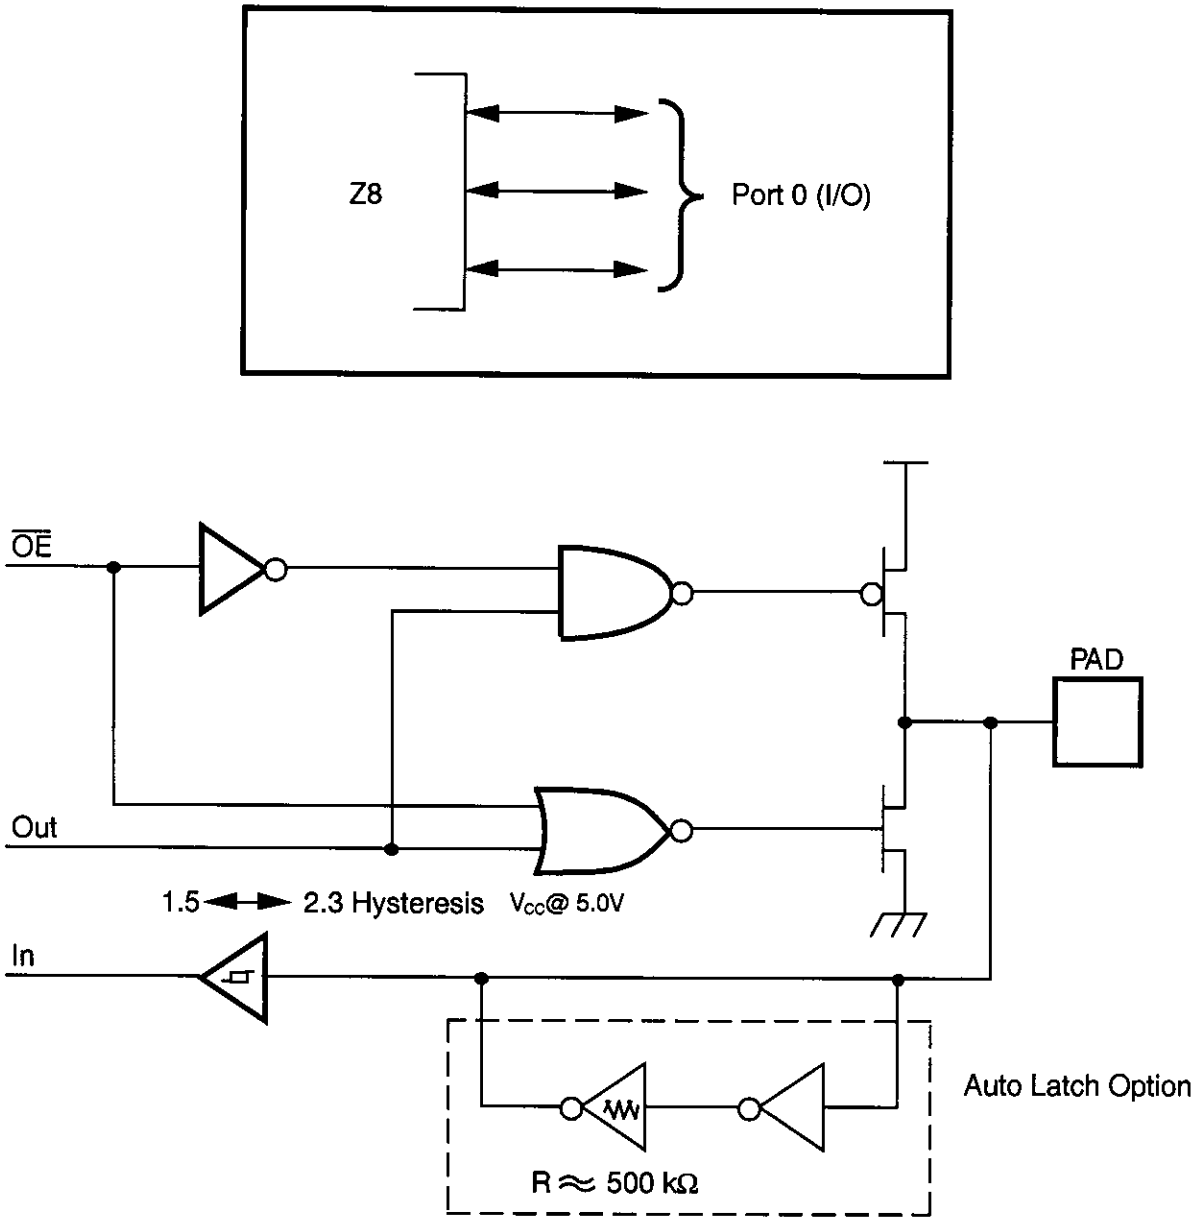

Figure 7. Port 0 Configuration

Port 2, P27–P20. Port 2 is an 8-bit, bit programmable, bidirectional, Schmitt-triggered CMOS-compatible I/O port. These eight I/O lines can be configured under software control to be inputs or outputs, independently. Bits programmed as outputs can be globally programmed as either push-pull or open-drain (Figure 8).

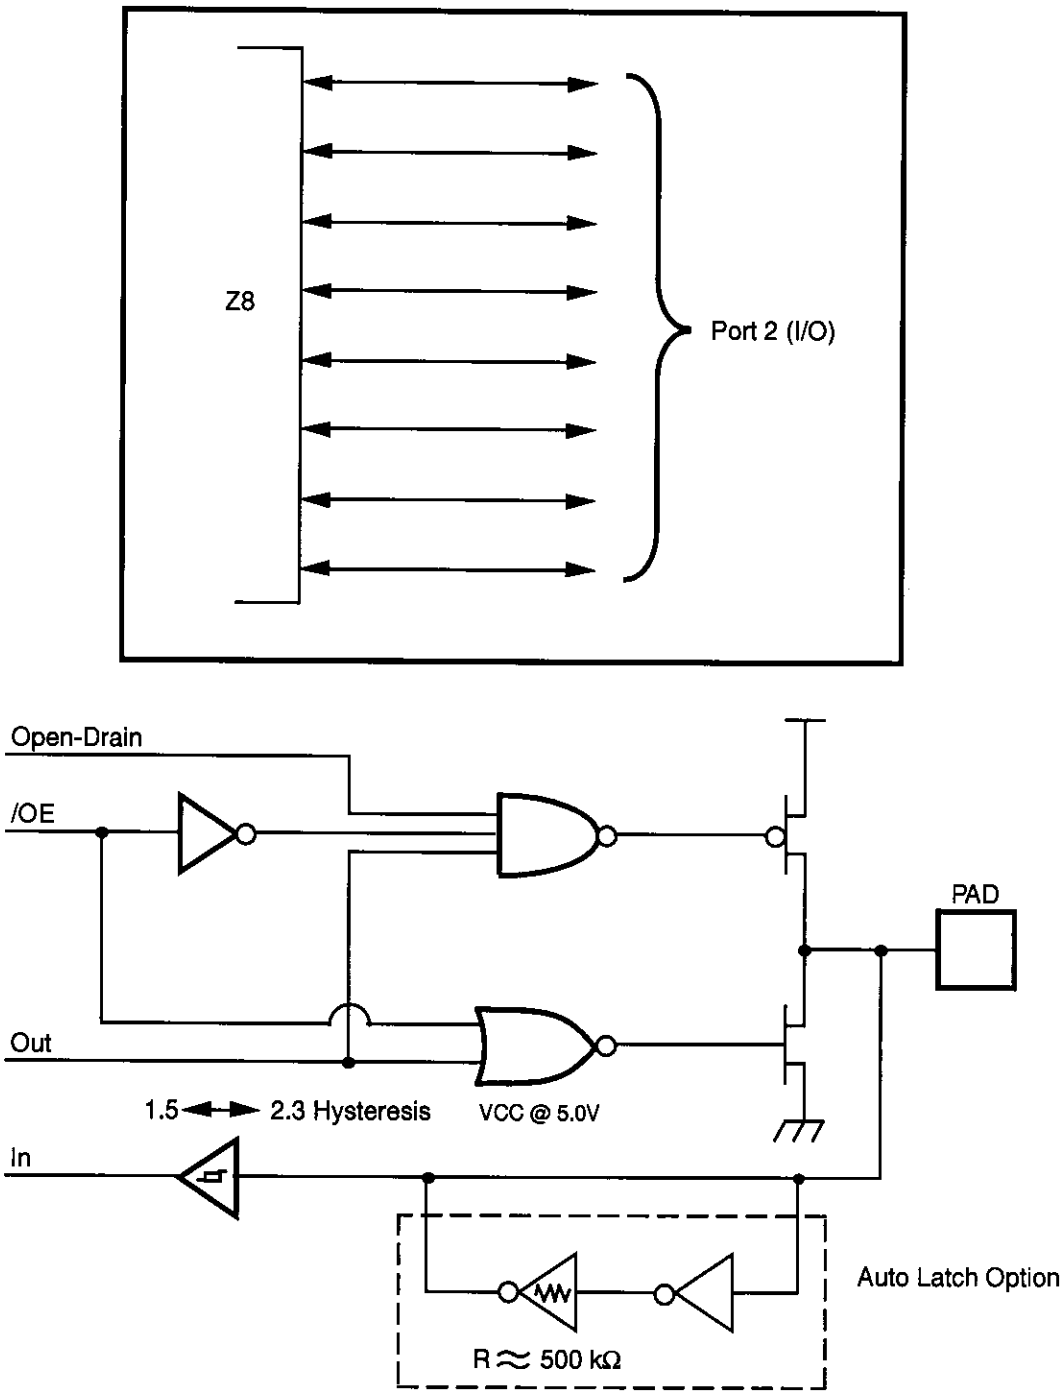

Figure 8. Port 2 Configuration

FUNCTIONAL DESCRIPTION (Continued)

The Z8 instructions can access registers directly or indirectly through an 8-bit address field. This allows short 4-bit register addressing using the Register Pointer.

In the 4-bit mode, the register file is divided into eight working register groups, each occupying 16 continuous locations. The Register Pointer (Figure 13) addresses the starting location of the active working-register group.

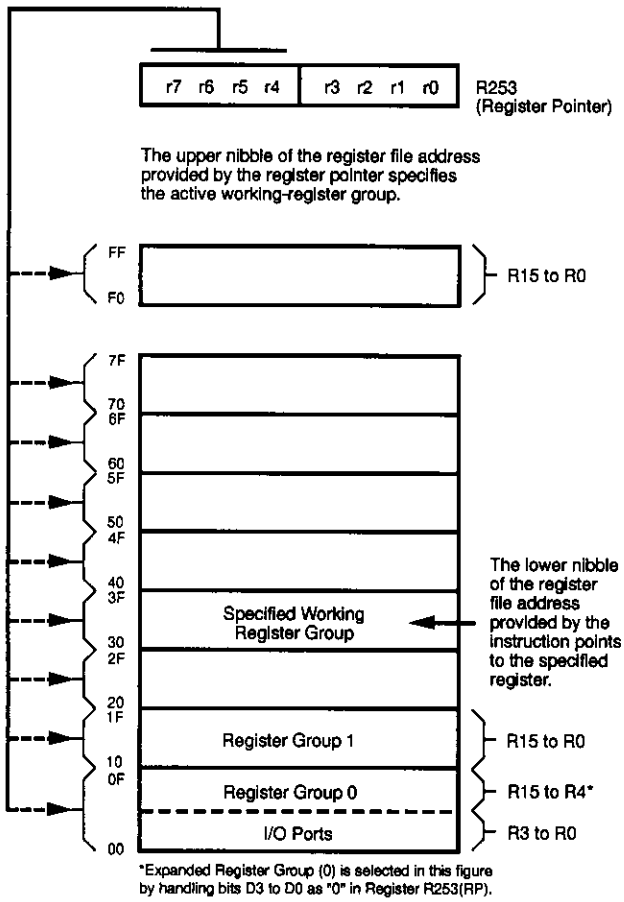

Figure 13. Register Pointer

Stack Pointer. The Z8 has an 8-bit Stack Pointer (R255) used for the internal stack that resides within the 124 general-purpose registers.

General-Purpose Registers (GPR). These registers are undefined after the device is powered up. The registers keep their last value after any reset, as long as the reset occurs in the V_{CC} voltage-specified operating range. **Note:** Register R254 has been designated as a general-purpose register and is set to 00 Hex after any reset or Stop-Mode Recovery.

Counter/Timer. There are two 8-bit programmable counter/timers (T0 and T1), each driven by its own 6-bit programmable prescaler. The T1 prescaler is driven by internal or external clock sources; however, the T0 can be driven by the internal clock source only (Figure 14).

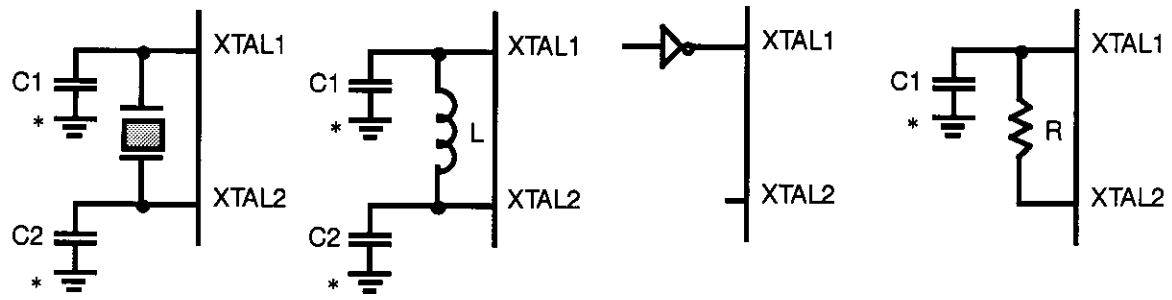
The 6-bit prescalers divide the input frequency of the clock source by any integer number from 1 to 64. Each prescaler drives its counter, which decrements the value (1 to 256) that has been loaded into the counter. When both counter and prescaler reach the end of count, a timer interrupt request IRQ4 (T0) or IRQ5 (T1) is generated.

The counter can be programmed to start, stop, restart to continue, or restart from the initial value. The counters are also programmed to stop upon reaching zero (Single-Pass Mode) or to automatically reload the initial value and continue counting (Modulo-N Continuous Mode).

The counters, but not the prescalers, are read at any time without disturbing their value or count mode. The clock source for T1 is user-definable and is either the internal microprocessor clock divided by four, or an external signal input through Port 3. The Timer Mode register configures the external timer input (P31) as an external clock, a trigger input that is retriggerable or non-retriggerable, or used as a gate input for the internal clock.

Clock. The Z8 on-chip oscillator has a high-gain, parallel-resonant amplifier for connection to a crystal, LC, RC, ceramic resonator, or any suitable external clock source (XTAL1 = INPUT, XTAL2 = OUTPUT). The crystal should be AT cut, up to 12 MHz max., with a series resistance (RS) of less than or equal to 100 Ohms.

The crystal should be connected across XTAL1 and XTAL2 using the vendors crystal recommended capacitors from each pin directly to device ground pin 14 (Figure 16). Note that the crystal capacitor loads should be connected to V_{SS}, Pin 14 to reduce Ground noise injection.



Ceramic Resonator or Crystal
C1, C2 = 47 pF TYP *

C1 = 100 pF
R = 2K
F = 6 MHz

* Typical value including pin parasitics

Figure 16. Oscillator Configuration

Low EMI Emission

The Z8 can be programmed to operate in a low EMI Emission (Low Noise) Mode by means of an EPROM programmable bit option. Use of this feature results in:

- Less than 1 mA consumed during HALT Mode.
- All drivers slew rates reduced to 10 ns (typical).
- Internal SCLK/TCLK = XTAL operation limited to a maximum of 4 MHz–250 ns cycle time.
- Output drivers have resistances of 500 ohms (typical).
- Oscillator divide-by-two circuitry eliminated.

In addition to V_{DD} and GND (V_{SS}), the Z8 changes all its pin functions in the EPROM Mode. XTAL2 has no function, XTAL1 functions as $\overline{CE}$, P31 functions as $\overline{OE}$, P32 functions as EPM, P33 functions as V_{PP}, and P02 functions as $\overline{PGM}$.

ROM Protect. ROM Protect fully protects the Z8 ROM code from being read externally. When ROM Protect is selected, the instructions LDC and LDCI **are supported** (Z86E04/E08 and Z86C04/C08 do not support the instructions of LDE and LDEI). When the device is programmed for ROM Protect, the Low Noise feature will not automatically be enabled.

Please note that when using the device in a noisy environment, it is suggested that the voltages on the EPM and $\overline{CE}$ pins be clamped to V_{CC} through a diode to V_{CC} to prevent accidentally entering the OTP Mode. The V_{PP} requires both a diode and a 100 pF capacitor.

Auto Latch Disable. Auto Latch Disable option bit when programmed will globally disable all Auto Latches.

WDT Enable. The WDT Enable option bit, when programmed, will have the hardware enabled Permanent WDT enabled after exiting reset and can not be stopped in Halt or Stop Mode.

EPROM/Test Mode Disable. The EPROM/Test Mode Disable option bit, when programmed, will disable the EPROM Mode and the Factory Test Mode. Reading, verifying, and programming the Z8 will be disabled. To fully verify that this mode is disabled, the device must be power cycled.

User Modes. Table 7 shows the programming voltage of each mode.

Table 7. OTP Programming Table

Programming Modes	V_{PP}	EPM	$\overline{CE}$	$\overline{OE}$	$\overline{PGM}$	ADDR	DATA	V_{CC}*
EPROM READ	NU	V_H	V_{IL}	V_{IL}	V_{IH}	ADDR	Out	5.0V
PROGRAM	V_H	V_{IH}	V_{IL}	V_{IH}	V_{IL}	ADDR	In	6.4V
PROGRAM VERIFY	V_H	V_{IH}	V_{IL}	V_{IL}	V_{IH}	ADDR	Out	6.4V
EPROM PROTECT	V_H	V_H	V_H	V_{IH}	V_{IL}	NU	NU	6.4V
LOW NOISE SELECT	V_H	V_{IH}	V_H	V_{IH}	V_{IL}	NU	NU	6.4V
AUTO LATCH DISABLE	V_H	V_{IH}	V_H	V_{IL}	V_{IL}	NU	NU	6.4V
WDT ENABLE	V_H	V_{IL}	V_H	V_{IH}	V_{IL}	NU	NU	6.4V
EPROM/TEST MODE	V_H	V_{IL}	V_H	V_{IL}	V_{IL}	NU	NU	6.4V

Notes:

1. V_H =12.75V ± 0.25 V_{DC} .
2. V_{IH} = As per specific Z8 DC specification.
3. V_{IL} = As per specific Z8 DC specification.
4. X = Not used, but must be set to V_H or V_{IH} level.
5. NU = Not used, but must be set to either V_{IH} or V_{IL} level.
6. I_{PP} during programming = 40 mA maximum.
7. I_{CC} during programming, verify, or read = 40 mA maximum.
8. * V_{CC} has a tolerance of ±0.25V.

FUNCTIONAL DESCRIPTION (Continued)

Internal Address Counter. The address of Z8 is generated internally with a counter clocked through pin P01 (Clock). Each clock signal increases the address by one and the "high" level of pin P00 (Clear) will reset the address to zero. Figure 18 shows the setup time of the serial address input.

Programming Waveform. Figures 19, 20, 21 and 22 show the programming waveforms of each mode. Table 8 shows the timing of programming waveforms.

Programming Algorithm. Figure 23 shows the flow chart of the Z8 programming algorithm.

Table 8. Timing of Programming Waveforms

Pre-Characterization Product:

The product represented by this CPS is newly introduced and Zilog has not completed the full characterization of the product. The CPS states what Zilog knows about this product at this time, but additional features or nonconformance with some aspects of the CPS may be found, either by Zilog or its customers in the course of further application and characterization work. In addition, Zilog cautions that delivery may be uncertain at times, due to start-up yield issues.
