

Welcome to **E-XFL.COM**

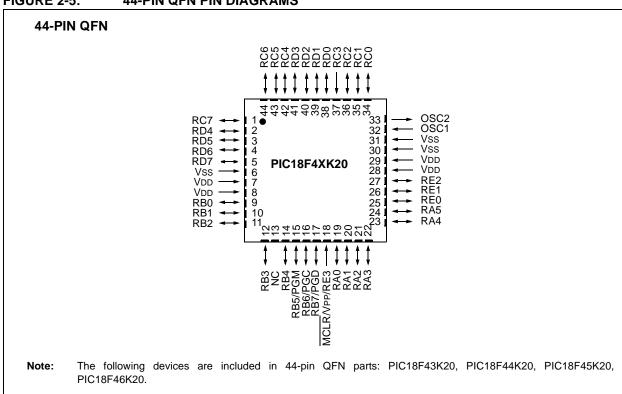

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "<u>Embedded - Microcontrollers</u>"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	48MHz
Connectivity	I ² C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, HLVD, POR, PWM, WDT
Number of I/O	24
Program Memory Size	8KB (4K x 16)
Program Memory Type	FLASH
EEPROM Size	256 x 8
RAM Size	512 x 8
Voltage - Supply (Vcc/Vdd)	1.8V ~ 3.6V
Data Converters	A/D 11x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Through Hole
Package / Case	28-DIP (0.300", 7.62mm)
Supplier Device Package	28-SPDIP
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic18f23k20-e-sp

For PIC18FX4K20 devices, the code memory space extends from 000000h to 003FFFh (16 Kbytes) in two 8-Kbyte blocks. Addresses 000000h through 0007FFh, however, define a "Boot Block" region that is treated separately from Block 0. All of these blocks define code protection boundaries within the code memory space.

TABLE 2-3: IMPLEMENTATION OF CODE MEMORY

Device	Code Memory Size (Bytes)	
PIC18F24K20	000000h 003EEEh (16K)	
PIC18F44K20	000000h-003FFFh (16K)	

FIGURE 2-7: MEMORY MAP AND THE CODE MEMORY SPACE FOR PIC18FX4K20 DEVICES

2.6 Entering and Exiting Low-Voltage ICSP Program/Verify Mode

When the LVP Configuration bit is '1' (see **Section 5.3** "**Single-Supply ICSP Programming**"), the Low-Voltage ICSP mode is enabled. As shown in Figure 2-14, Low-Voltage ICSP Program/Verify mode is entered by holding PGC and PGD low, placing a logic high on PGM and then raising MCLR/VPP/RE3 to VIH. In this mode, the RB5/PGM pin is dedicated to the programming function and ceases to be a general purpose I/O pin. Figure 2-15 shows the exit sequence.

The sequence that enters the device into the Program/ Verify mode places all unused I/Os in the high-impedance state.

FIGURE 2-14: ENTERING LOW-VOLTAGE PROGRAM/VERIFY MODE

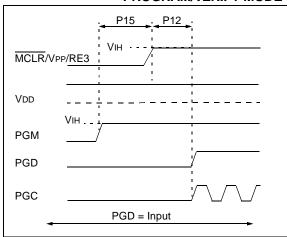

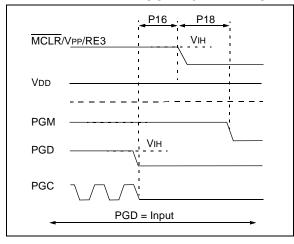

FIGURE 2-15: EXITING LOW-VOLTAGE PROGRAM/VERIFY MODE

2.7 Serial Program/Verify Operation

The PGC pin is used as a clock input pin and the PGD pin is used for entering command bits and data input/output during serial operation. Commands and data are transmitted on the rising edge of PGC, latched on the falling edge of PGC and are Least Significant bit (LSb) first.

2.7.1 4-BIT COMMANDS

All instructions are 20 bits, consisting of a leading 4-bit command followed by a 16-bit operand, which depends on the type of command being executed. To input a command, PGC is cycled four times. The commands needed for programming and verification are shown in Table 2-6.

Depending on the 4-bit command, the 16-bit operand represents 16 bits of input data or 8 bits of input data and 8 bits of output data.

Throughout this specification, commands and data are presented as illustrated in Table 2-7. The 4-bit command is shown Most Significant bit (MSb) first. The command operand, or "Data Payload", is shown <MSB><LSB>. Figure 2-16 demonstrates how to serially present a 20-bit command/operand to the device.

2.7.2 CORE INSTRUCTION

The core instruction passes a 16-bit instruction to the CPU core for execution. This is needed to set up registers as appropriate for use with other commands.

TABLE 2-6: COMMANDS FOR PROGRAMMING

Description	4-Bit Command
Core Instruction (Shift in16-bit instruction)	0000
Shift out TABLAT register	0010
Table Read	1000
Table Read, post-increment	1001
Table Read, post-decrement	1010
Table Read, pre-increment	1011
Table Write	1100
Table Write, post-increment by 2	1101
Table Write, start programming, post-increment by 2	1110
Table Write, start programming	1111

3.0 DEVICE PROGRAMMING

Programming includes the ability to erase or write the various memory regions within the device.

In all cases, except high-voltage ICSP Bulk Erase, the EECON1 register must be configured in order to operate on a particular memory region.

When using the EECON1 register to act on code memory, the EEPGD bit must be set (EECON1<7>=1) and the CFGS bit must be cleared (EECON1<6>=0). The WREN bit must be set (EECON1<2>=1) to enable writes of any sort (e.g., erases) and this must be done prior to initiating a write sequence. The FREE bit must be set (EECON1<4>=1) in order to erase the program space being pointed to by the Table Pointer. The erase or write sequence is initiated by setting the WR bit (EECON1<1>=1). It is strongly recommended that the WREN bit only be set immediately prior to a program or erase.

3.1 ICSP Erase

3.1.1 HIGH-VOLTAGE ICSP BULK ERASE

Erasing code or data EEPROM is accomplished by configuring two Bulk Erase Control registers located at 3C0004h and 3C0005h. Code memory may be erased portions at a time, or the user may erase the entire device in one action. Bulk Erase operations will also clear any code-protect settings associated with the memory block erased. Erase options are detailed in Table 3-1. If data EEPROM is code-protected (CPD = 0), the user must request an erase of data EEPROM (e.g., 0084h as shown in Table 3-1).

TABLE 3-1: BULK ERASE OPTIONS

TABLE O II. BOLK LIGHT	2 01 110110	
Description	Data (3C0005h:3C0004h)	
Chip Erase	0F8Fh	
Erase User ID	0088h	
Erase Data EEPROM	0084h	
Erase Boot Block	0081h	
Erase Config Bits	0082h	
Erase Code EEPROM Block 0	0180h	
Erase Code EEPROM Block 1	0280h	
Erase Code EEPROM Block 2	0480h	
Erase Code EEPROM Block 3	0880h	

The actual Bulk Erase function is a self-timed operation. Once the erase has started (falling edge of the 4th PGC after the NOP command), serial execution will cease until the erase completes (parameter P11). During this time, PGC may continue to toggle but PGD must be held low.

The code sequence to erase the entire device is shown in Table 3-2 and the flowchart is shown in Figure 3-1.

A Bulk Erase is the only way to reprogram code-protect bits from an "on" state to an "off" state.

TABLE 3-2: BULK ERASE COMMAND SEQUENCE

4-Bit Command	Data Payload	Core Instruction
0000	0E 3C	MOVLW 3Ch
0000	6E F8	MOVWF TBLPTRU
0000	0E 00	MOVLW 00h
0000	6E F7	MOVWF TBLPTRH
0000	0E 05	MOVLW 05h
0000	6E F6	MOVWF TBLPTRL
1100	0F 0F	Write OFh to 3C0005h
0000	0E 3C	MOVLW 3Ch
0000	6E F8	MOVWF TBLPTRU
0000	0E 00	MOVLW 00h
0000	6E F7	MOVWF TBLPTRH
0000	0E 04	MOVLW 04h
0000	6E F6	MOVWF TBLPTRL
1100	8F 8F	Write 8F8Fh TO 3C0004h to erase entire device.
0000	00 00	NOP
0000	00 00	Hold PGD low until erase completes.

FIGURE 3-1: BULK ERASE FLOW

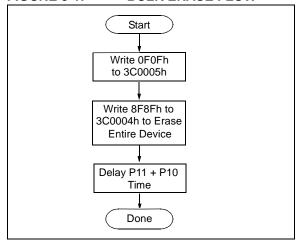

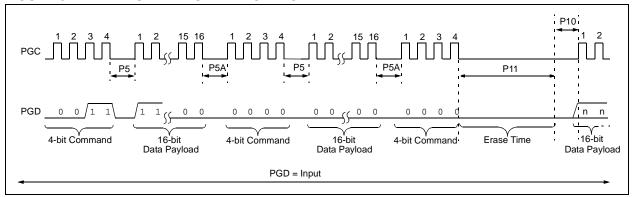

FIGURE 3-2: **BULK ERASE TIMING DIAGRAM**

LOW-VOLTAGE ICSP BULK ERASE 3.1.2

When using low-voltage ICSP, the part must be supplied by the voltage specified in parameter D111 if a Bulk Erase is to be executed. All other Bulk Erase details as described above apply.

If it is determined that a program memory erase must be performed at a supply voltage below the Bulk Erase limit, refer to the erase methodology described in Section 3.1.3 "ICSP Row Erase" and Section 3.2.1 "Modifying Code Memory".

If it is determined that a data EEPROM erase must be performed at a supply voltage below the Bulk Erase limit, follow the methodology described in Section 3.3 "Data EEPROM Programming" and write '1's to the array.

3.1.3 **ICSP ROW ERASE**

Regardless of whether high or low-voltage ICSP is used, it is possible to erase one row (64 bytes of data), provided the block is not code or write-protected. Rows are located at static boundaries beginning at program memory address 000000h, extending to the internal program memory limit (see Section 2.3 "Memory Maps").

The Row Erase duration is self-timed. After the WR bit in EECON1 is set, two NOPs are issued. Erase starts upon the 4th PGC of the second NOP. It ends when the WR bit is cleared by hardware.

The code sequence to Row Erase a PIC18F2XK20/ 4XK20 device is shown in Table 3-3. The flowchart shown in Figure 3-3 depicts the logic necessary to completely erase a PIC18F2XK20/4XK20 device. The timing diagram for Row Erase is identical to the data EEPROM write timing shown in Figure 3-7.

Note: The TBLPTR register can point at any byte within the row intended for erase.

TABLE 3-3: ERASE CODE MEMORY CODE SEQUENCE

4-bit Command	Data Payload	Core Instruction	
Step 1: Direct ad	ccess to code memor	y and enable writes.	
0000 0000 0000	8E A6 9C A6 84 A6	BSF EECON1, EEPGD BCF EECON1, CFGS BSF EECON1, WREN

0000	94 A6	BCF EECON1, WREN	

Note 1: See Figure 4-4 for details on shift out data timing.

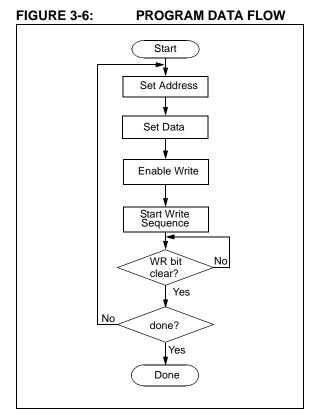

3.3 Data EEPROM Programming

Data EEPROM is accessed one byte at a time via an Address Pointer (register pair EEADRH:EEADR) and a data latch (EEDATA). Data EEPROM is written by loading EEADRH:EEADR with the desired memory location, EEDATA with the data to be written and initiating a memory write by appropriately configuring the EECON1 register. A byte write automatically erases the location and writes the new data (erase-before-write).

When using the EECON1 register to perform a data EEPROM write, both the EEPGD and CFGS bits must be cleared (EECON1<7:6> = 00). The WREN bit must be set (EECON1<2> = 1) to enable writes of any sort and this must be done prior to initiating a write sequence. The write sequence is initiated by setting the WR bit (EECON1<1> = 1).

The write begins on the falling edge of the 24th PGC after the WR bit is set. It ends when the WR bit is cleared by hardware.

After the programming sequence terminates, PGC must be held low for the time specified by parameter P10 to allow high-voltage discharge of the memory array.

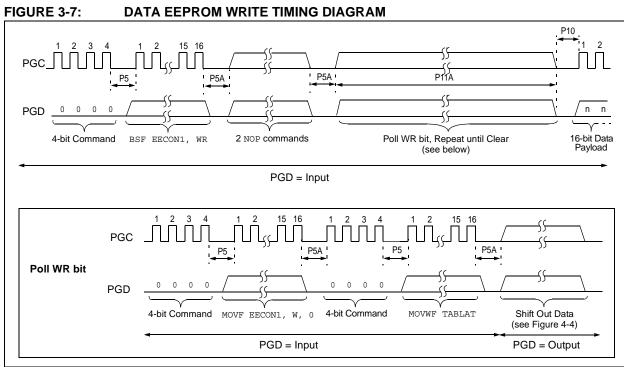

TABLE 3-7: PROGRAMMING DATA MEMORY

4-bit Command	Data Payload	Core Instruction	
Step 1: Direct ad	Step 1: Direct access to data EEPROM.

Step 7: Hold PG	Step 7: Hold PGC low for time P10.		
Step 8: Disable	Step 8: Disable writes.		
0000	94 A6	BCF EECON1, WREN	
Repeat steps 2	Repeat steps 2 through 8 to write more data.		

Note 1: See Figure 4-4 for details on shift out data timing.

4.0 READING THE DEVICE

4.1 Read Code Memory, ID Locations and Configuration Bits

Code memory is accessed one byte at a time via the 4-bit command, '1001' (table read, post-increment). The contents of memory pointed to by the Table Pointer (TBLPTRU:TBLPTRH:TBLPTRL) are serially output on PGD.

The 4-bit command is shifted in LSb first. The read is executed during the next 8 clocks, then shifted out on PGD during the last 8 clocks, LSb to MSb. A delay of P6 must be introduced after the falling edge of the 8th

PGC of the operand to allow PGD to transition from an input to an output. During this time, PGC must be held low (see Figure 4-1). This operation also increments the Table Pointer by one, pointing to the next byte in code memory for the next read.

This technique will work to read any memory in the 000000h to 3FFFFFh address space, so it also applies to the reading of the ID and Configuration registers.

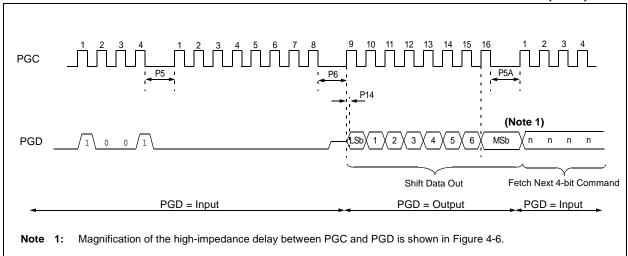

When table read protection is enabled, the first read access to a protected block should be discarded and the read repeated to retrieve valid data. Subsequent reads of the same block can be performed normally.

TABLE 4-1: READ CODE MEMORY SEQUENCE

4-bit Command	Data Payload	Core Instruction	
Step 1: Set Tabl	e Pointer		
0000	0E <addr[21:16]></addr[21:16]>	MOVLW Addr[21:16]	
0000	6E F8	MOVWF TBLPTRU	
0000	0E <addr[15:8]></addr[15:8]>	MOVLW <addr[15:8]></addr[15:8]>

0000	0E <addr[7:0]></addr[7:0]>	MOVLW <addr[7:0]></addr[7:0]>	
0000	6E F6	MOVWF TBLPTRL	
Step 2: Read m	Step 2: Read memory and then shift out on PGD, LSb to MSb		
1001	00 00	TBLRD *+	

Note:

FIGURE 4-1: TABLE READ POST-INCREMENT INSTRUCTION TIMING DIAGRAM (1001)

4.2 Verify Code Memory and ID Locations

The verify step involves reading back the code memory space and comparing it against the copy held in the programmer's buffer. Memory reads occur a single byte at a time, so two bytes must be read to compare against the word in the programmer's buffer. Refer to Section 4.1 "Read Code Memory, ID Locations and Configuration Bits" for implementation details of reading code memory.

The Table Pointer must be manually set to 200000h (base address of the ID locations) once the code memory has been verified. The post-increment feature of the table read 4-bit command can not be used to increment the Table Pointer beyond the code memory space. In a 64-Kbyte device, for example, a post-increment read of address FFFFh will wrap the Table Pointer back to 000000h, rather than point to unimplemented address 010000h.

FIGURE 4-2: VERIFY CODE MEMORY FLOW

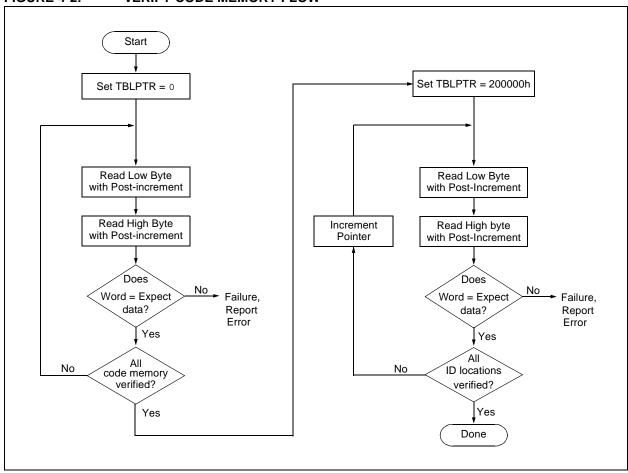

FIGURE 4-4: SHIFT OUT DATA HOLDING REGISTER TIMING DIAGRAM (0010)

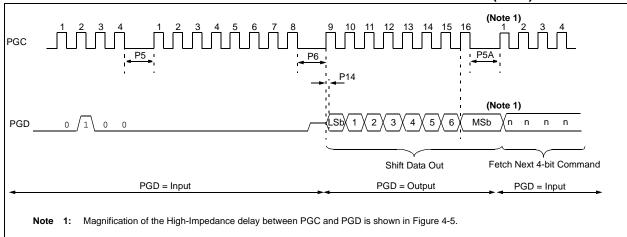

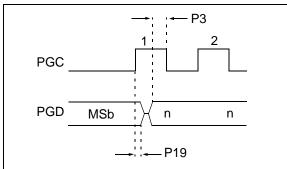

FIGURE 4-5: HIGH-IMPEDANCE DELAY

4.5 Verify Data EEPROM

A data EEPROM address may be read via a sequence of core instructions (4-bit command, '0000') and then output on PGD via the 4-bit command, '0010' (TABLAT register). The result may then be immediately compared to the appropriate data in the programmer's memory for verification. Refer to **Section 4.4 "Read Data EEPROM Memory"** for implementation details of reading data EEPROM.

4.6 Blank Check

The term "Blank Check" means to verify that the device has no programmed memory cells. All memories must be verified: code memory, data EEPROM, ID locations and Configuration bits. The device ID registers (3FFFFEh:3FFFFFh) should be ignored.

A "blank" or "erased" memory cell will read as a '1'. Therefore, Blank Checking a device merely means to verify that all bytes read as FFh except the Configuration bits. Unused (reserved) Configuration bits will read '0' (programmed). Refer to Table 5-1 for blank configuration expect data for the various PIC18F2XK20/4XK20 devices.

Given that Blank Checking is merely code and data EEPROM verification with FFh expect data, refer to Section 4.4 "Read Data EEPROM Memory" and Section 4.2 "Verify Code Memory and ID Locations" for implementation details.

FIGURE 4-6: BLANK CHECK FLOW

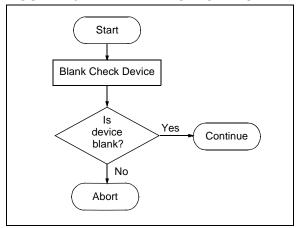

TABLE 5-2: DEVICE ID VALUE

Device	Device ID Value	
Device	DEVID2	DEVID1
PIC18F23K20	20h	111x xxxx
PIC18F24K20	20h	101x xxxx

		These bits are used with the DEV<10:3> bits in the DEVID2 register to identify part number.
REV<4:0>	DEVID1	Revision ID bits
		These bits are used to indicate the revision of the device.

5.3 Single-Supply ICSP Programming

The LVP bit in Configuration register, CONFIG4L, enables Single-Supply (Low-Voltage) ICSP Programming. The LVP bit defaults to a '1' (enabled) from the factory.

If Single-Supply Programming mode is not used, the LVP bit can be programmed to a '0' and RB5/PGM becomes a digital I/O pin. However, the LVP bit may only be programmed by entering the High-Voltage ICSP mode, where MCLR/VPP/RE3 is raised to VIHH. Once the LVP bit is programmed to a '0', only the High-Voltage ICSP mode is available and only the High-Voltage ICSP mode can be used to program the device.

- Note 1: The High-Voltage ICSP mode is always available, regardless of the state of the LVP bit, by applying VIHH to the MCLR/VPP/RE3 pin.
 - 2: While in Low-Voltage ICSP mode, the RB5 pin can no longer be used as a general purpose I/O.

5.4 Embedding Configuration Word Information in the HEX File

To allow portability of code, a PIC18F2XK20/4XK20 programmer is required to read the Configuration Word locations from the hex file. If Configuration Word information is not present in the hex file, then a simple warning message should be issued. Similarly, while saving a hex file, all Configuration Word information must be included. An option to not include the Configuration Word information may be provided. When embedding Configuration Word information in the hex file, it should start at address 300000h.

Microchip Technology Inc. feels strongly that this feature is important for the benefit of the end customer.

5.5 Embedding Data EEPROM Information In the HEX File

To allow portability of code, a PIC18F2XK20/4XK20 programmer is required to read the data EEPROM information from the hex file. If data EEPROM information is not present, a simple warning message should be issued. Similarly, when saving a hex file, all data EEPROM information must be included. An option to not include the data EEPROM information may be provided. When embedding data EEPROM information in the hex file, it should start at address F00000h.

Microchip Technology Inc. believes that this feature is important for the benefit of the end customer.

5.6 Checksum Computation

The checksum is calculated by summing the following:

- The contents of all code memory locations
- The Configuration Word, appropriately masked
- ID locations (Only if any portion of program memory is code-protected)

The Least Significant 16 bits of this sum are the checksum.

Code protection limits access to program memory by both external programmer (code-protect) and code execution (table read protect). The ID locations, when included in a code protected checksum, contain the checksum of an unprotected part. The unprotected checksum is distributed: one nibble per ID location. Each nibble is right justified.

Table 5-4 describes how to calculate the checksum for each device.

Note:

The checksum calculation differs depending on the code-protect setting. Since the code memory locations read out differently depending on the code-protect setting, the table describes how to manipulate the actual code memory values to simulate the values that would be read from a protected device. When calculating a checksum by reading a device, the entire code memory can simply be read and summed. The Configuration Word and ID locations can always be read.

TABLE 5-4: CHECKSUM COMPUTATION

Device	Code- Protect	Checksum	Blank Value	0xAA at 0 and Max Address
PIC18FX3K20	None	SUM[0000:01FF]+SUM[0200:0FFF]+SUM[1000:1FFF]+ (CONFIG1L & 00h)+(CONFIG1H & CFh)+(CONFIG2L & 1Fh)+ (CONFIG2H & 1F)+(CONFIG3L & 00h)+(CONFIG3H & 8Fh)+ (CONFIG4L & C5h)+(CONFIG4H & 00h)+(CONFIG5L & 03h)+ (CONFIG5H & C0h)+(CONFIG6L & 03h)+(CONFIG6H & E0h)+ (CONFIG7L & 03h)+(CONFIG7H & 40h)	E33Eh	E294h

SUM_ID = Byte-wise sum of lower four bits of all customer ID locations

+ = Addition & = Bit-wise AND

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks

The Microchip name and logo, the Microchip logo, dsPIC, Keeloq, Keeloq logo, MPLAB, PIC, PICmicro, PICSTART, rfPIC and UNI/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

FilterLab, Hampshire, HI-TECH C, Linear Active Thermistor, MXDEV, MXLAB, SEEVAL and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Analog-for-the-Digital Age, Application Maestro, CodeGuard, dsPICDEM, dsPICDEM.net, dsPICworks, dsSPEAK, ECAN, ECONOMONITOR, FanSense, HI-TIDE, In-Circuit Serial Programming, ICSP, Mindi, MiWi, MPASM, MPLAB Certified logo, MPLIB, MPLINK, mTouch, Octopus, Omniscient Code Generation, PICC, PICC-18, PICDEM, PICDEM.net, PICkit, PICtail, PIC³² logo, REAL ICE, rfLAB, Select Mode, Total Endurance, TSHARC, UniWinDriver, WiperLock and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

All other trademarks mentioned herein are property of their respective companies.

© 2009, Microchip Technology Incorporated, Printed in the U.S.A., All Rights Reserved.

Printed on recycled paper.

Microchip received ISO/TS-16949:2002 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
