
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

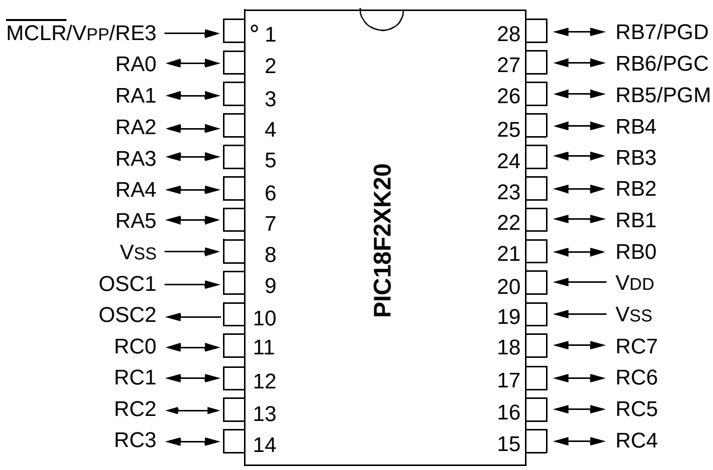
"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	64MHz
Connectivity	I²C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, HLVD, POR, PWM, WDT
Number of I/O	24
Program Memory Size	8KB (4K x 16)
Program Memory Type	FLASH
EEPROM Size	256 x 8
RAM Size	512 x 8
Voltage - Supply (Vcc/Vdd)	1.8V ~ 3.6V
Data Converters	A/D 11x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	28-VQFN Exposed Pad
Supplier Device Package	28-QFN (6x6)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic18f23k20t-i-ml

FIGURE 2-1: 28-PIN SDIP, SSOP AND SOIC PIN DIAGRAMS

SDIP, SSOP, SOIC (300 MIL)



Note: The following devices are included in 28-pin SDIP, SSOP and SOIC parts: PIC18F23K20, PIC18F24K20, PIC18F25K20, PIC18F26K20.

FIGURE 2-2: 28-PIN QFN PIN DIAGRAMS

28-Pin QFN

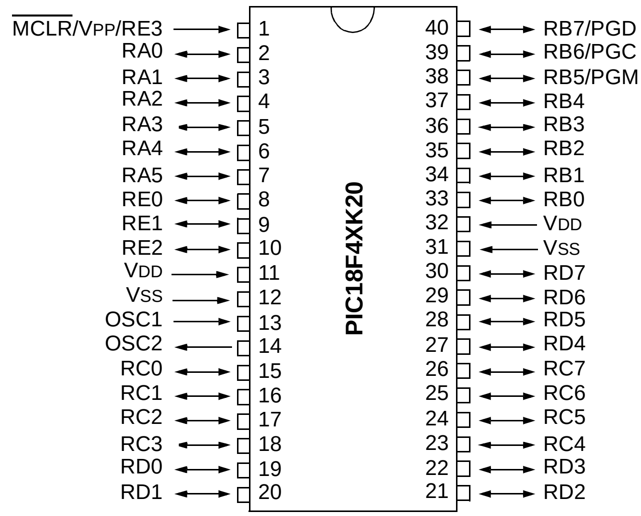
FIGURE 2-3: 40-PIN PDIP PIN DIAGRAMS

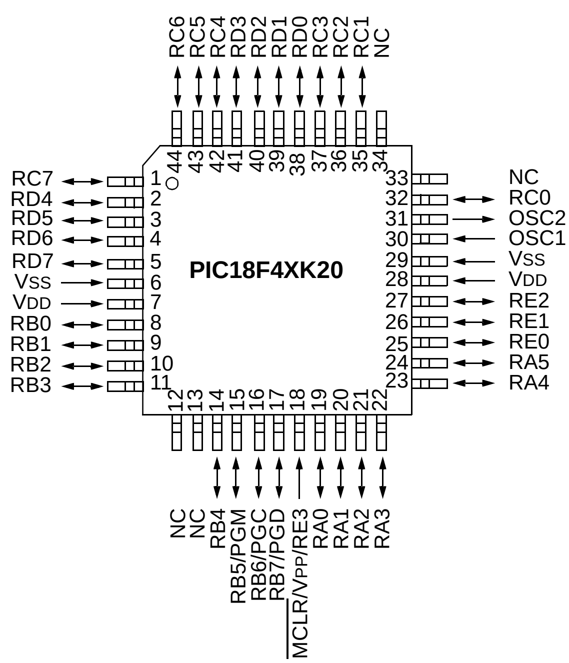
40-PIN PDIP (600 MIL)



Note: The following devices are included in 40-pin PDIP parts: PIC18F43K20, PIC18F44K20, PIC18F45K20, PIC18F46K20.

FIGURE 2-4: 44-PIN TQFP PIN DIAGRAMS

44-PIN TQFP



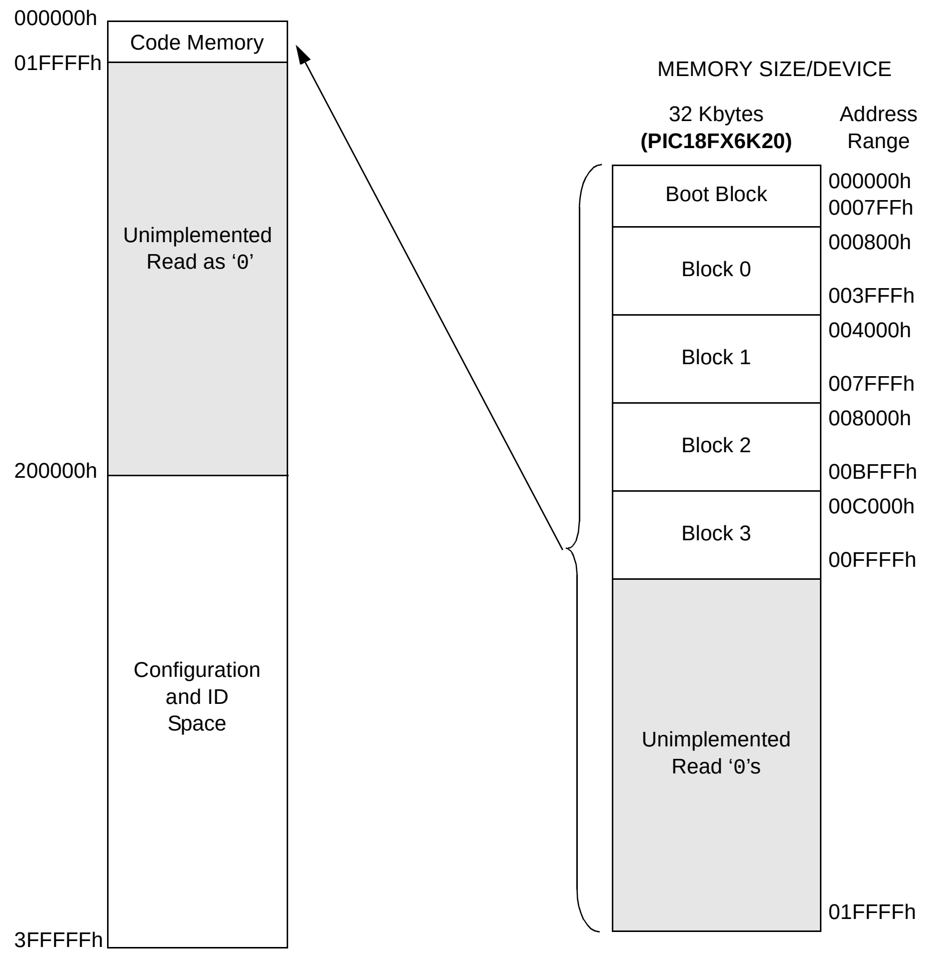
Note: The following devices are included in 44-pin TQFP parts: PIC18F43K20, PIC18F44K20, PIC18F45K20, PIC18F46K20.

For PIC18FX6K20 devices, the code memory space extends from 000000h to 00FFFFh (64 Kbytes) in four 16-Kbyte blocks. Addresses 000000h through 0007FFh, however, define a “Boot Block” region that is treated separately from Block 0. All of these blocks define code protection boundaries within the code memory space.

TABLE 2-5: IMPLEMENTATION OF CODE MEMORY

Device	Code Memory Size (Bytes)
PIC18F26K20	000000h-00FFFFh (64K)
PIC18F46K20	

FIGURE 2-9: MEMORY MAP AND THE CODE MEMORY SPACE FOR PIC18FX6K20 DEVICES



Note: Sizes of memory areas not to scale.

 Advance Information

In addition to the code memory space, there are three blocks in the configuration and ID space that are accessible to the user through table reads and table writes. Their locations in the memory map are shown in Figure 2-10.

Users may store identification information (ID) in eight ID registers. These ID registers are mapped in addresses 200000h through 200007h. The ID locations read out normally, even after code protection is applied.

Locations 300000h through 30000Dh are reserved for the Configuration bits. These bits select various device options and are described in **Section 5.0 "Configuration Word"**. These Configuration bits read out normally, even after code protection.

Locations 3FFFFEh and 3FFFFFh are reserved for the device ID bits. These bits may be used by the programmer to identify what device type is being programmed and are described in **Section 5.0 "Configuration Word"**. These device ID bits read out normally, even after code protection.

2.3.1 MEMORY ADDRESS POINTER

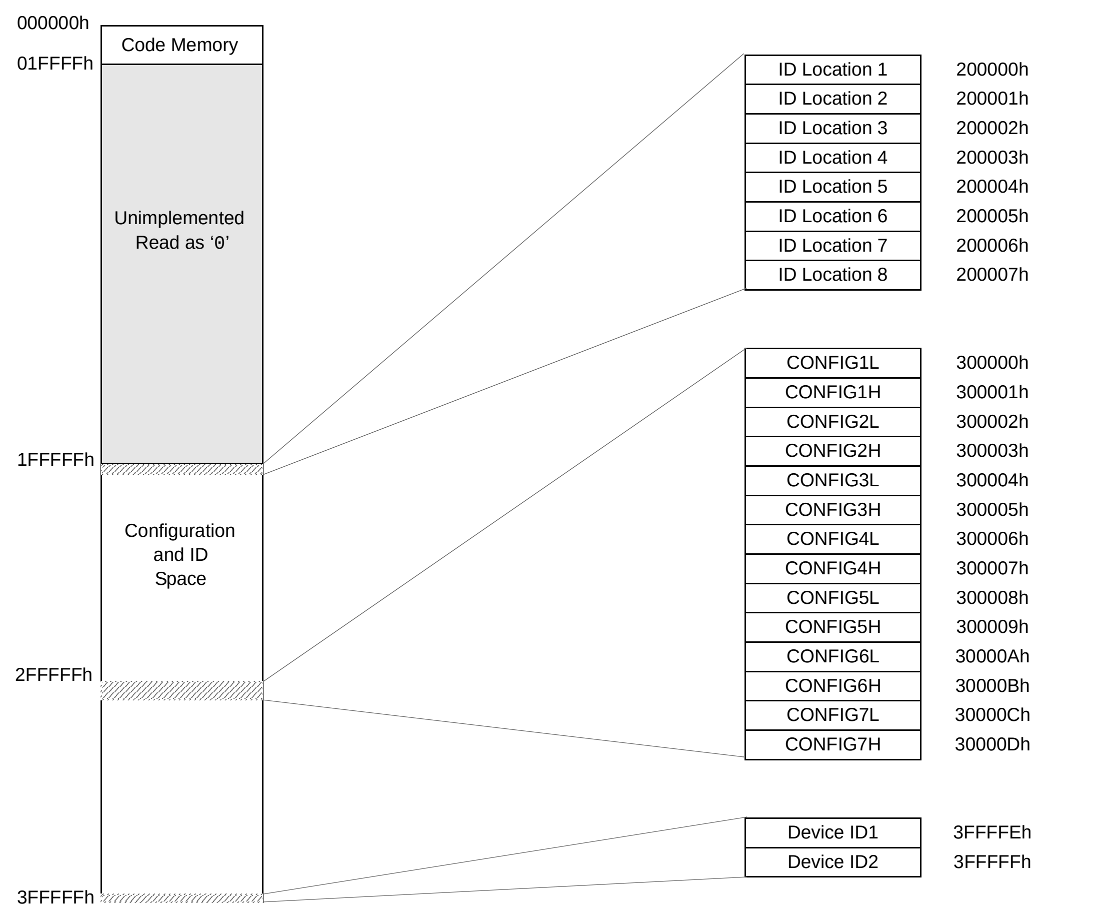
Memory in the address space, 0000000h to 3FFFFFh, is addressed via the Table Pointer register, which is comprised of three Pointer registers:

- TBLPTRU, at RAM address 0FF8h
- TBLPTRH, at RAM address 0FF7h
- TBLPTRL, at RAM address 0FF6h

TBLPTRU	TBLPTRH	TBLPTRL
Addr[21:16]	Addr[15:8]	Addr[7:0]

The 4-bit command, '`0000`' (core instruction), is used to load the Table Pointer prior to using any read or write operations.

FIGURE 2-10: CONFIGURATION AND ID LOCATIONS FOR PIC18F2XK20/4XK20 DEVICES

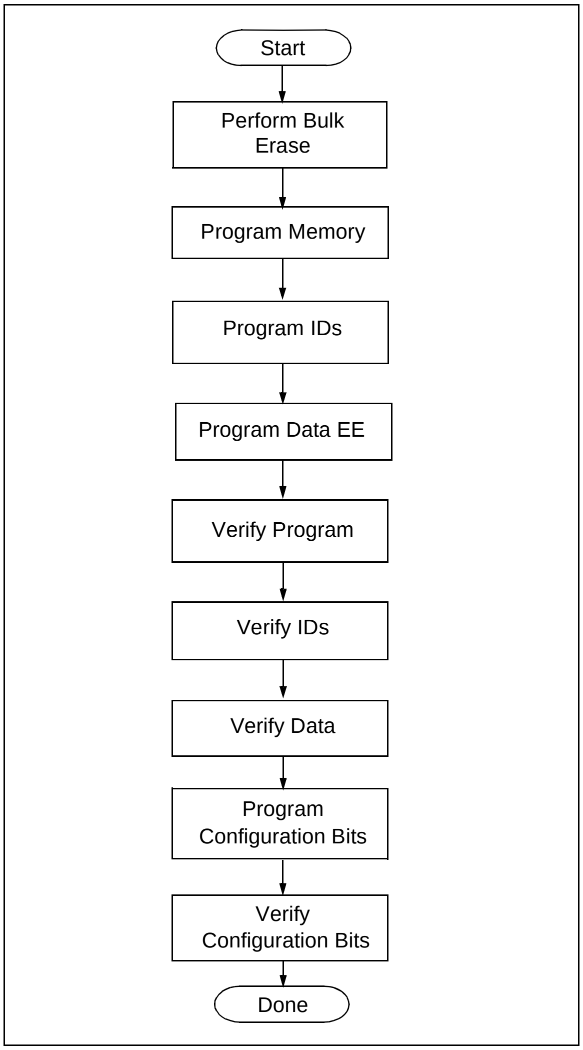


Note: Sizes of memory areas are not to scale.

2.4 High-Level Overview of the Programming Process

Figure 2-11 shows the high-level overview of the programming process. First, a Bulk Erase is performed. Next, the code memory, ID locations and data EEPROM are programmed. These memories are then verified to ensure that programming was successful. If no errors are detected, the Configuration bits are then programmed and verified.

FIGURE 2-11: HIGH-LEVEL PROGRAMMING FLOW



2.5 Entering and Exiting High-Voltage ICSP Program/Verify Mode

As shown in Figure 2-12, the High-Voltage ICSP Program/Verify mode is entered by holding PGC and PGD low and then raising $\overline{\text{MCLR}}$/VPP/RE3 to VIHH (high voltage). Once in this mode, the code memory, data EEPROM, ID locations and Configuration bits can be accessed and programmed in serial fashion. Figure 2-13 shows the exit sequence.

The sequence that enters the device into the Program/Verify mode places all unused I/Os in the high-impedance state.

FIGURE 2-12: ENTERING HIGH-VOLTAGE PROGRAM/VERIFY MODE

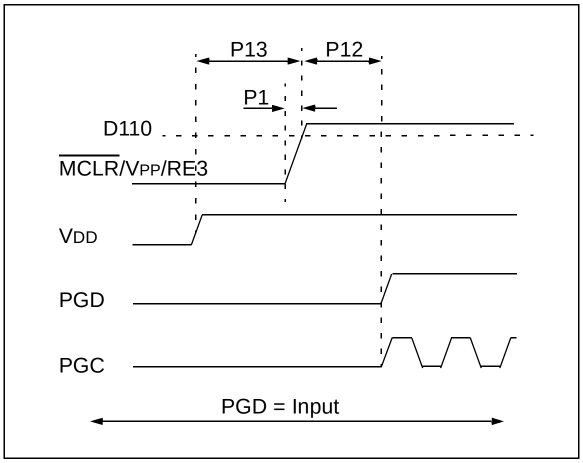


FIGURE 2-13: EXITING HIGH-VOLTAGE PROGRAM/VERIFY MODE

 Advance Information

2.6 Entering and Exiting Low-Voltage ICSP Program/Verify Mode

When the LVP Configuration bit is '1' (see **Section 5.3 "Single-Supply ICSP Programming"**), the Low-Voltage ICSP mode is enabled. As shown in Figure 2-14, Low-Voltage ICSP Program/Verify mode is entered by holding PGC and PGD low, placing a logic high on PGM and then raising $\overline{MCLR}$/VPP/RE3 to VIH. In this mode, the RB5/PGM pin is dedicated to the programming function and ceases to be a general purpose I/O pin. Figure 2-15 shows the exit sequence.

The sequence that enters the device into the Program/Verify mode places all unused I/Os in the high-impedance state.

FIGURE 2-14: ENTERING LOW-VOLTAGE PROGRAM/VERIFY MODE

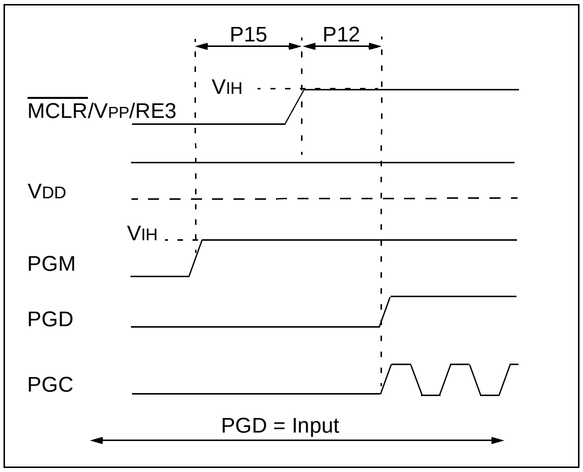

FIGURE 2-15: EXITING LOW-VOLTAGE PROGRAM/VERIFY MODE

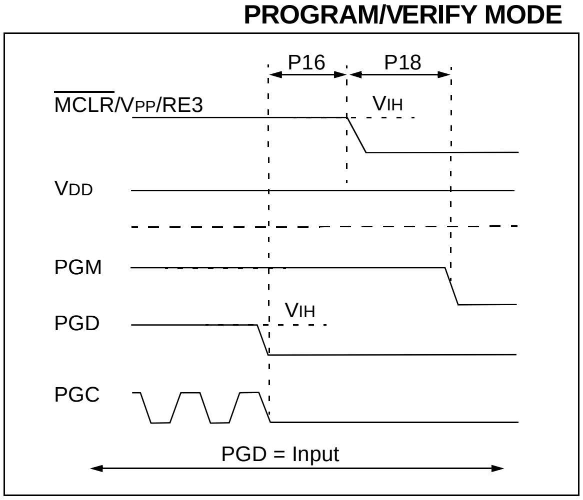

2.7 Serial Program/Verify Operation

The PGC pin is used as a clock input pin and the PGD pin is used for entering command bits and data input/output during serial operation. Commands and data are transmitted on the rising edge of PGC, latched on the falling edge of PGC and are Least Significant bit (LSb) first.

2.7.1 4-BIT COMMANDS

All instructions are 20 bits, consisting of a leading 4-bit command followed by a 16-bit operand, which depends on the type of command being executed. To input a command, PGC is cycled four times. The commands needed for programming and verification are shown in Table 2-6.

Depending on the 4-bit command, the 16-bit operand represents 16 bits of input data or 8 bits of input data and 8 bits of output data.

Throughout this specification, commands and data are presented as illustrated in Table 2-7. The 4-bit command is shown Most Significant bit (MSb) first. The command operand, or "Data Payload", is shown <MSB><LSB>. Figure 2-16 demonstrates how to serially present a 20-bit command/operand to the device.

2.7.2 CORE INSTRUCTION

The core instruction passes a 16-bit instruction to the CPU core for execution. This is needed to set up registers as appropriate for use with other commands.

TABLE 2-6: COMMANDS FOR PROGRAMMING

Description	4-Bit Command
Core Instruction (Shift in16-bit instruction)	0000
Shift out TABLAT register	0010
Table Read	1000
Table Read, post-increment	1001
Table Read, post-decrement	1010
Table Read, pre-increment	1011
Table Write	1100
Table Write, post-increment by 2	1101
Table Write, start programming, post-increment by 2	1110
Table Write, start programming	1111

TABLE 3-3: ERASE CODE MEMORY CODE SEQUENCE

4-bit Command	Data Payload	Core Instruction
Step 1: Direct access to code memory and enable writes.		

`0000`
`0000`
`0000`
	8E A6
	9C A6
	84 A6
		`BSF EECON1, EEPGD`

		`MOVF EECON1, W, 0`
		`MOVWF TABLAT`
		`NOP`
		`Shift out data`(1)

Step 5: Hold PGC low for time P10.		
Step 6: Repeat step 3 with Address Pointer incremented by 64 until all rows are erased.		
Step 7: Disable writes.		
`0000`	94 A6	`BCF EECON1, WREN`

Note 1: See Figure 4-4 for details on shift out data timing.

3.2 Code Memory Programming

Programming code memory is accomplished by first loading data into the write buffer and then initiating a programming sequence. The write and erase buffer sizes shown in Table 3-4 can be mapped to any location of the same size beginning at 000000h. The actual memory write sequence takes the contents of this buffer and programs the proper amount of code memory that contains the Table Pointer.

The programming duration is externally timed and is controlled by PGC. After a Start Programming command is issued (4-bit command, '`1111`'), a `NOP` is issued, where the 4th PGC is held high for the duration of the programming time, P9.

After PGC is brought low, the programming sequence is terminated. PGC must be held low for the time specified by parameter P10 to allow high-voltage discharge of the memory array.

The code sequence to program a PIC18F2XK20/4XK20 device is shown in Table 3-5. The flowchart shown in Figure 3-4 depicts the logic necessary to completely write a PIC18F2XK20/4XK20 device. The timing diagram that details the Start Programming command and parameters P9 and P10 is shown in Figure 3-5.

> **Note:** The TBLPTR register must point to the same region when initiating the programming sequence as it did when the write buffers were loaded.

TABLE 3-4: WRITE AND ERASE BUFFER SIZES

Devices (Arranged by Family)	Write Buffer Size (bytes)	Erase Size (bytes)
PIC18F26K20, PIC18F46K20	64	64
PIC18F24K20, PIC18F25K20, PIC18F44K20, PIC18F45K20	32	64
PIC18F23K20, PIC18F43K20	16	64

		`MOVWF TBLPTRU`
		`MOVLW <Addr[15:8]>`
		`MOVWF TBLPTRH`
		`MOVLW <Addr[7:0]>`
		`MOVWF TBLPTRL`

Step 3: Load write buffer. Repeat for all but the last two bytes.		
`1101`	<MSB><LSB>	`Write 2 bytes and post-increment address by 2.`
Step 4: Load write buffer for last two bytes and start programming.		
`1111` `0000`	<MSB><LSB> 00 00	`Write 2 bytes and start programming.` `NOP - hold PGC high for time P9 and low for time P10.`
To continue writing data, repeat steps 2 through 4, where the Address Pointer is incremented by 2 at each iteration of the loop.		

FIGURE 3-4: PROGRAM CODE MEMORY FLOW

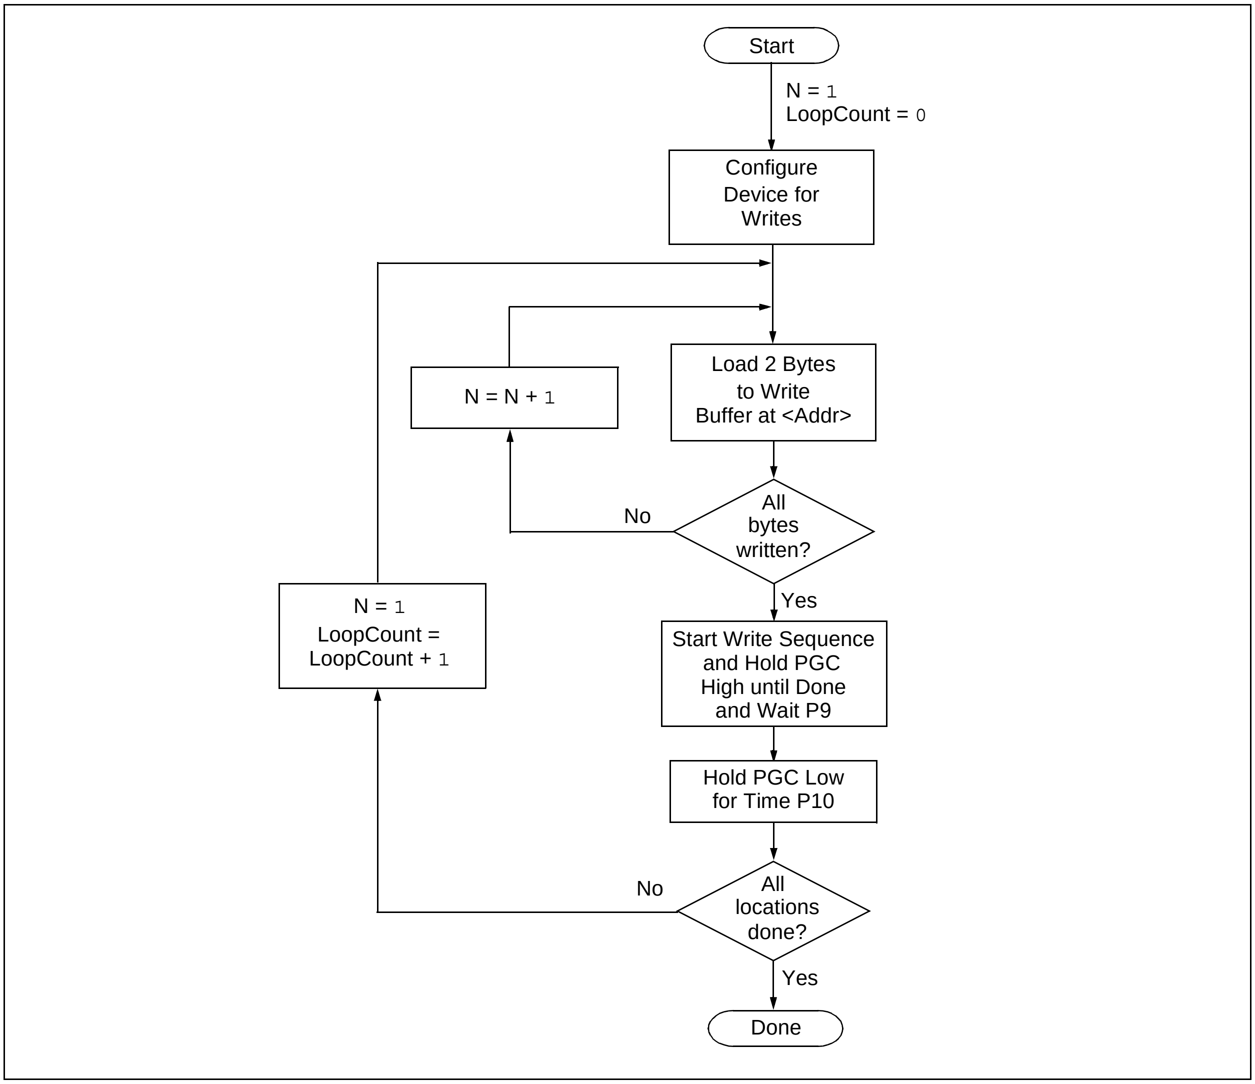

FIGURE 3-5: TABLE WRITE AND START PROGRAMMING INSTRUCTION TIMING DIAGRAM (1111)

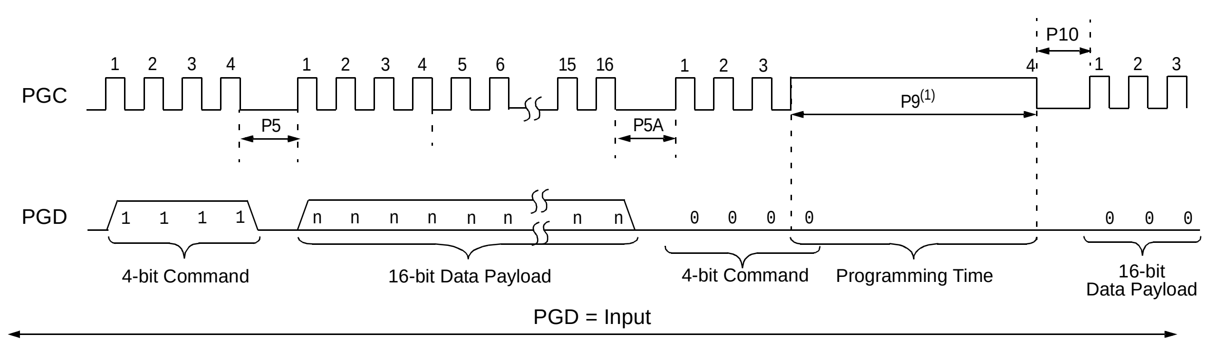

Note 1: Use P9A for User ID and Configuration Word programming.

3.3 Data EEPROM Programming

Data EEPROM is accessed one byte at a time via an Address Pointer (register pair EEADRH:EEADR) and a data latch (EEDATA). Data EEPROM is written by loading EEADRH:EEADR with the desired memory location, EEDATA with the data to be written and initiating a memory write by appropriately configuring the EECON1 register. A byte write automatically erases the location and writes the new data (erase-before-write).

When using the EECON1 register to perform a data EEPROM write, both the EEPGD and CFGS bits must be cleared (EECON1<7:6> = `00`). The WREN bit must be set (EECON1<2> = `1`) to enable writes of any sort and this must be done prior to initiating a write sequence. The write sequence is initiated by setting the WR bit (EECON1<1> = `1`).

The write begins on the falling edge of the 24th PGC after the WR bit is set. It ends when the WR bit is cleared by hardware.

After the programming sequence terminates, PGC must be held low for the time specified by parameter P10 to allow high-voltage discharge of the memory array.

FIGURE 3-6: PROGRAM DATA FLOW

		`Shift out data`(1)

Step 7: Hold PGC low for time P10.		
Step 8: Disable writes.		
0000	94 A6	`BCF EECON1, WREN`
Repeat steps 2 through 8 to write more data.		

Note 1: See Figure 4-4 for details on shift out data timing.

3.4 ID Location Programming

The ID locations are programmed much like the code memory. The ID registers are mapped in addresses 200000h through 200007h. These locations read out normally even after code protection.

> **Note:** The user only needs to fill the first 8 bytes of the write buffer in order to write the ID locations.

Table 3-8 demonstrates the code sequence required to write the ID locations.

In order to modify the ID locations, refer to the methodology described in **Section 3.2.1 "Modifying Code Memory"**. As with code memory, the ID locations must be erased before being modified.

When VDD is below the minimum for Bulk Erase operation, ID locations can be cleared with the Row Erase method described in **Section 3.1.3 "ICSP Row Erase"**.

TABLE 3-8: WRITE ID SEQUENCE

4-bit Command	Data Payload	Core Instruction
Step 1: Direct access to code memory.		
`0000`	8E A6	`BSF EECON1, EEPGD`
`0000`	9C A6	`BCF EECON1, CFGS`
`0000`	84 A6	`BSF EECON1, WREN`
Step 2: Set Table Pointer to ID. Load write buffer with 8 bytes and write.		
`0000`	0E 20	`MOVLW 20h`
`0000`	6E F8	`MOVWF TBLPTRU`
`0000`	0E 00	`MOVLW 00h`
`0000`	6E F7	`MOVWF TBLPTRH`
`0000`	0E 00	`MOVLW 00h`
`0000`	6E F6	`MOVWF TBLPTRL`
`1101`	<MSB><LSB>	`Write 2 bytes and post-increment address by 2.`
`1101`	<MSB><LSB>	`Write 2 bytes and post-increment address by 2.`
`1101`	<MSB><LSB>	`Write 2 bytes and post-increment address by 2.`
`1111`	<MSB><LSB>	`Write 2 bytes and start programming.`
`0000`	00 00	`NOP - hold PGC high for time P9 and low for time P10.`

3.5 Boot Block Programming

The code sequence detailed in Table 3-5 should be used, except that the address used in “Step 2” will be in the range of 000000h to 0007FFh.

3.6 Configuration Bits Programming

Unlike code memory, the Configuration bits are programmed a byte at a time. The Table Write, Begin Programming 4-bit command (‘1111’) is used, but only 8 bits of the following 16-bit payload will be written. The LSB of the payload will be written to even addresses and the MSB will be written to odd addresses. The code sequence to program two consecutive configuration locations is shown in Table 3-9. See Figure 3-5 for the timing diagram.

> **Note:** The address must be explicitly written for each byte programmed. The addresses can not be incremented in this mode.

TABLE 3-9: SET ADDRESS POINTER TO CONFIGURATION LOCATION

4-bit Command	Data Payload	Core Instruction
Step 1: Direct access to config memory.

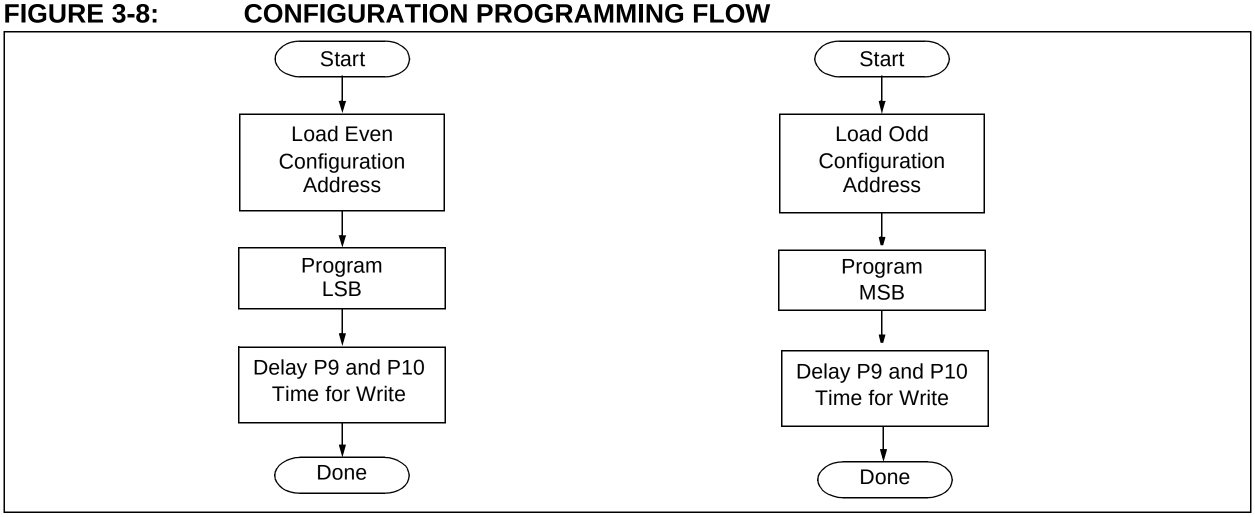
		`NOP - hold PGC high for time P9 and low for time P10.`
		`MOVLW 01h`
		`MOVWF TBLPTRL`
		`Load 2 bytes and start programming.`
		`NOP - hold PGC high for time P9A and low for time P10.`

Note 1: Enabling the write protection of Configuration bits (WRTC = 0 in CONFIG6H) will prevent further writing of Configuration bits. Always write all the Configuration bits before enabling the write protection for Configuration bits.

FIGURE 3-8: CONFIGURATION PROGRAMMING FLOW

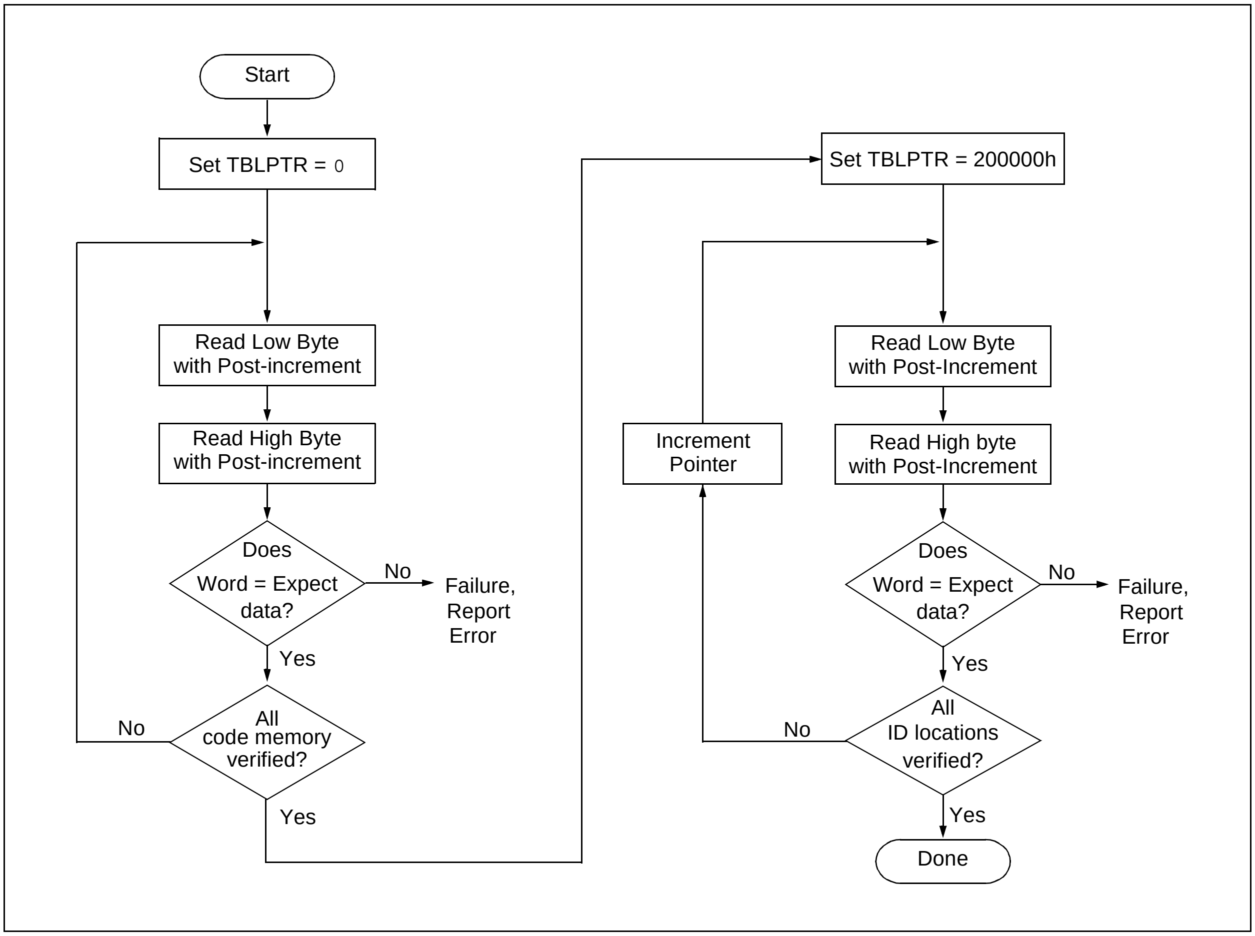


4.2 Verify Code Memory and ID Locations

The verify step involves reading back the code memory space and comparing it against the copy held in the programmer's buffer. Memory reads occur a single byte at a time, so two bytes must be read to compare against the word in the programmer's buffer. Refer to **Section 4.1 "Read Code Memory, ID Locations and Configuration Bits"** for implementation details of reading code memory.

The Table Pointer must be manually set to 200000h (base address of the ID locations) once the code memory has been verified. The post-increment feature of the table read 4-bit command can not be used to increment the Table Pointer beyond the code memory space. In a 64-Kbyte device, for example, a post-increment read of address FFFFh will wrap the Table Pointer back to 000000h, rather than point to unimplemented address 010000h.

FIGURE 4-2: VERIFY CODE MEMORY FLOW



5.0 CONFIGURATION WORD

The PIC18F2XK20/4XK20 devices have several Configuration Words. These bits can be set or cleared to select various device configurations. All other memory areas should be programmed and verified prior to setting Configuration Words. These bits may be read out normally, even after read or code protection. See Table 5-1 for a list of Configuration bits and device IDs and Table 5-3 for the Configuration bit descriptions.

5.1 User ID Locations

A user may store identification information (ID) in eight ID locations mapped in 200000h:200007h. It is recommended that the Most Significant nibble of each ID be Fh. In doing so, if the user code inadvertently tries to execute from the ID space, the ID data will execute as a `NOP`.

5.2 Device ID Word

The device ID word for the PIC18F2XK20/4XK20 devices is located at 3FFFFEh:3FFFFFh. These bits may be used by the programmer to identify what device type is being programmed and read out normally, even after code or read protection. See Table 5-2 for a complete list of device ID values.

FIGURE 5-1: READ DEVICE ID WORD FLOW

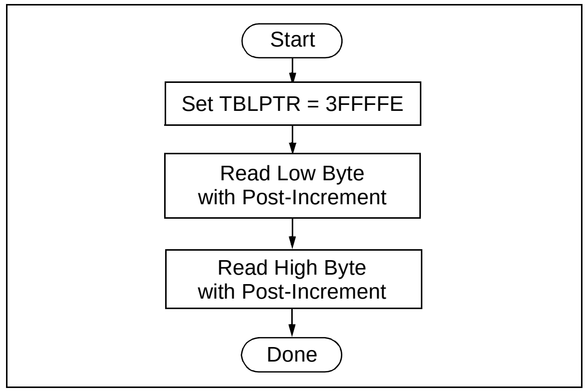


TABLE 5-1: CONFIGURATION BITS AND DEVICE IDs

File Name		Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Default/ Unprogrammed Value

3FFFFFh	DEVID2[2]	DEV10	DEV9	DEV8	DEV7	DEV6	DEV5	DEV4	DEV3	See Table 5-2

Legend: `x` = unknown, `u` = unchanged, – = unimplemented. Shaded cells are unimplemented, read as ‘`0`’.

Note 1: These bits are only implemented on specific devices. Refer to **Section 2.3 “Memory Maps”** to determine which bits apply based on available memory.

2: DEVID registers are read-only and cannot be programmed by the user.

TABLE 5-3: PIC18F2XK20/4XK20 BIT DESCRIPTIONS

Bit Name	Configuration Words	Description
IESO	CONFIG1H	Internal External Switchover bit 1 = Internal External Switchover mode enabled 0 = Internal External Switchover mode disabled
