
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

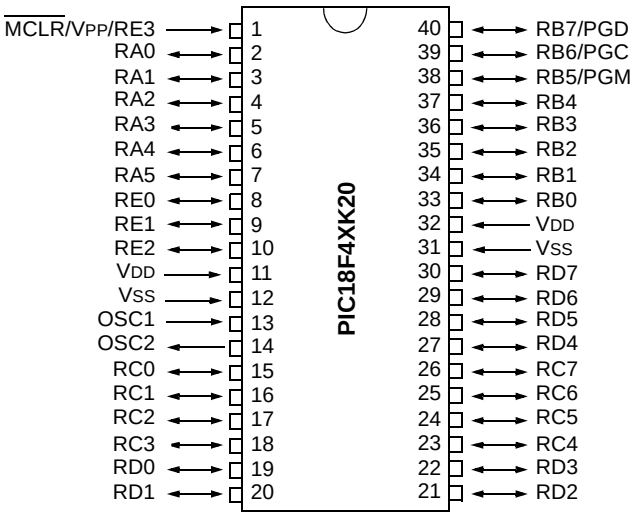
"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	64MHz
Connectivity	I²C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, HLVD, POR, PWM, WDT
Number of I/O	24
Program Memory Size	64KB (32K x 16)
Program Memory Type	FLASH
EEPROM Size	1K x 8
RAM Size	3.8K x 8
Voltage - Supply (Vcc/Vdd)	1.8V ~ 3.6V
Data Converters	A/D 11x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	28-VQFN Exposed Pad
Supplier Device Package	28-QFN (6x6)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic18f26k20t-i-ml

FIGURE 2-3: 40-PIN PDIP PIN DIAGRAMS

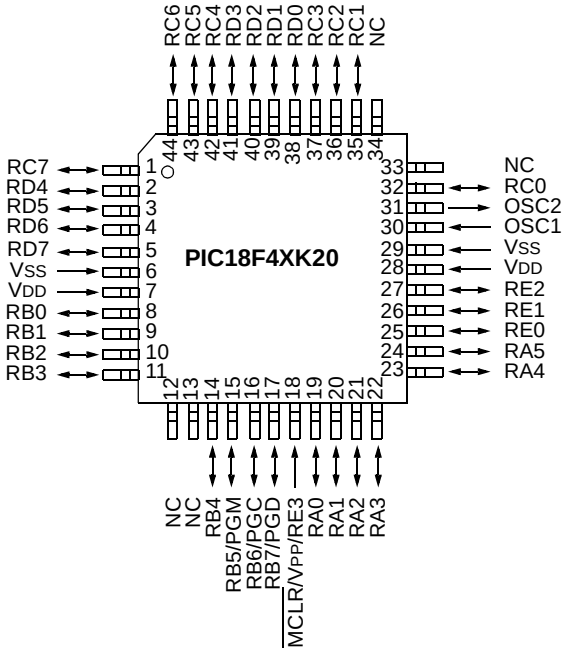
40-PIN PDIP (600 MIL)



Note: The following devices are included in 40-pin PDIP parts: PIC18F43K20, PIC18F44K20, PIC18F45K20, PIC18F46K20.

FIGURE 2-4: 44-PIN TQFP PIN DIAGRAMS

44-PIN TQFP



Note: The following devices are included in 44-pin TQFP parts: PIC18F43K20, PIC18F44K20, PIC18F45K20, PIC18F46K20.

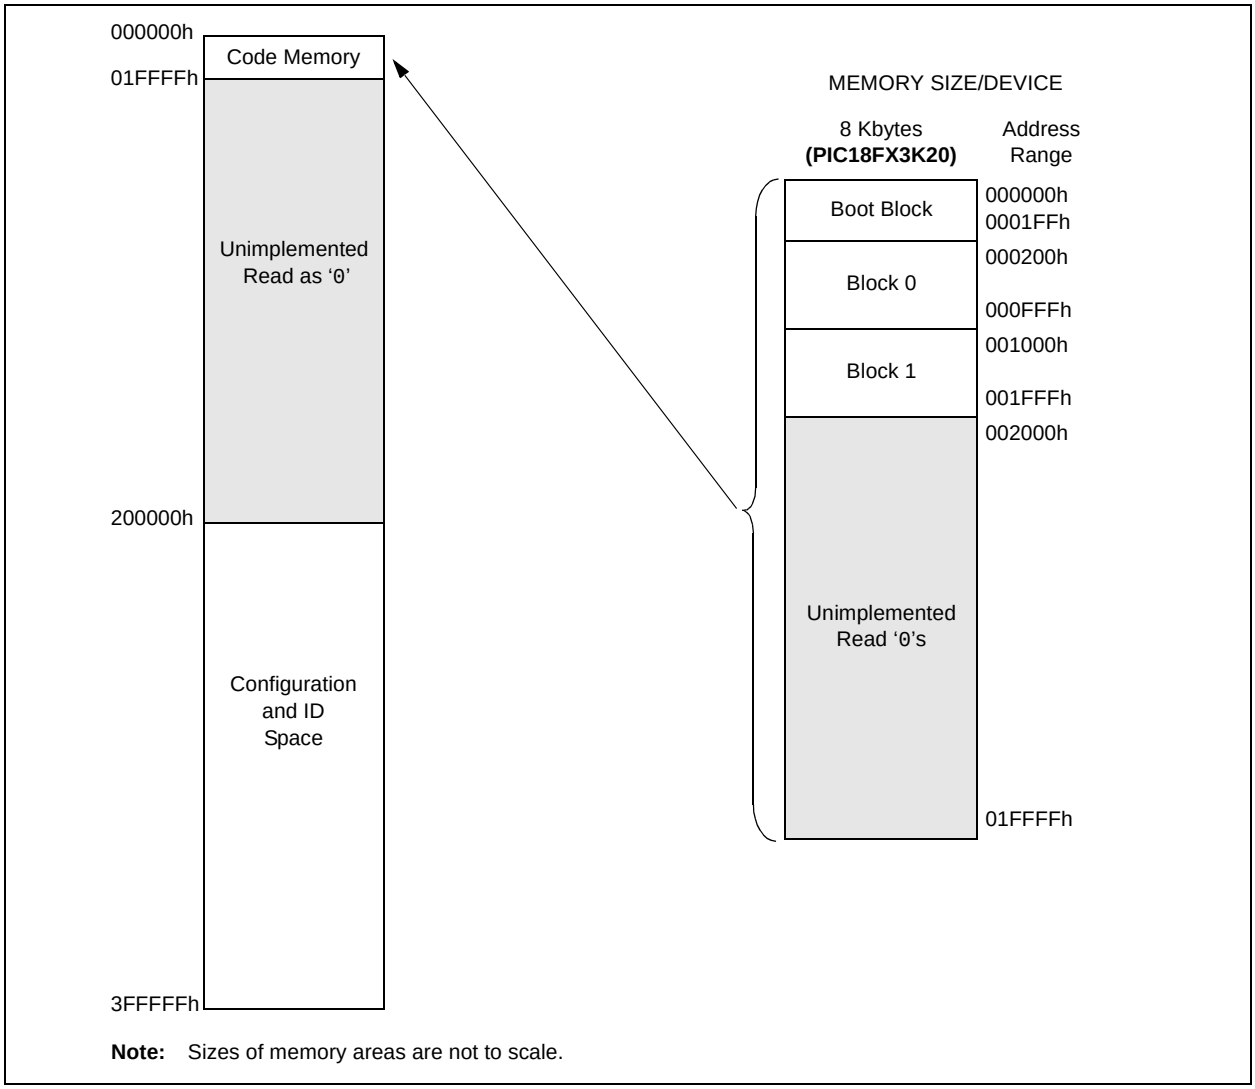
2.3 Memory Maps

For the PIC18FX3K20 devices, the code memory space extends from 0000h to 01FFFh (8 Kbytes) in two 4-Kbyte blocks. Addresses 0000h through 01FFh, however, define a “Boot Block” region that is treated separately from Block 0. All of these blocks define code protection boundaries within the code memory space.

TABLE 2-2: IMPLEMENTATION OF CODE MEMORY

Device	Code Memory Size (Bytes)
PIC18F23K20	000000h-001FFFh (8K)
PIC18F43K20	

FIGURE 2-6: MEMORY MAP AND THE CODE MEMORY SPACE FOR PIC18FX3K20 DEVICES



Note: Sizes of memory areas are not to scale.

For PIC18FX6K20 devices, the code memory space extends from 000000h to 00FFFFh (64 Kbytes) in four 16-Kbyte blocks. Addresses 000000h through 0007FFh, however, define a “Boot Block” region that is treated separately from Block 0. All of these blocks define code protection boundaries within the code memory space.

TABLE 2-5: IMPLEMENTATION OF CODE MEMORY

Device	Code Memory Size (Bytes)
PIC18F26K20	000000h-00FFFFh (64K)
PIC18F46K20

Note: Sizes of memory areas not to scale.

2.6 Entering and Exiting Low-Voltage ICSP Program/Verify Mode

When the LVP Configuration bit is '1' (see **Section 5.3 "Single-Supply ICSP Programming"**), the Low-Voltage ICSP mode is enabled. As shown in Figure 2-14, Low-Voltage ICSP Program/Verify mode is entered by holding PGC and PGD low, placing a logic high on PGM and then raising MCLR/VPP/RE3 to VIH. In this mode, the RB5/PGM pin is dedicated to the programming function and ceases to be a general purpose I/O pin. Figure 2-15 shows the exit sequence.

The sequence that enters the device into the Program/Verify mode places all unused I/Os in the high-impedance state.

FIGURE 2-14: ENTERING LOW-VOLTAGE PROGRAM/VERIFY MODE

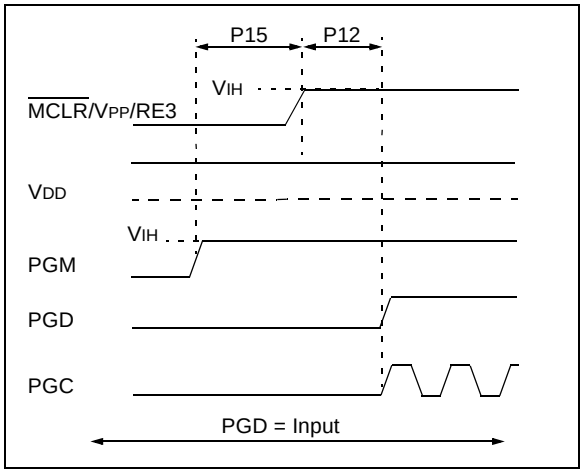

FIGURE 2-15: EXITING LOW-VOLTAGE PROGRAM/VERIFY MODE

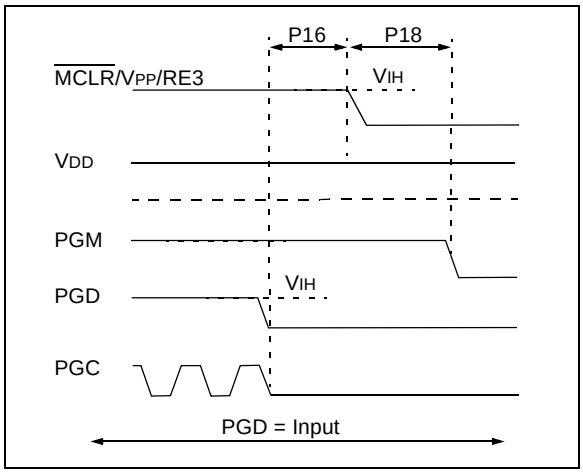

2.7 Serial Program/Verify Operation

The PGC pin is used as a clock input pin and the PGD pin is used for entering command bits and data input/output during serial operation. Commands and data are transmitted on the rising edge of PGC, latched on the falling edge of PGC and are Least Significant bit (LSb) first.

2.7.1 4-BIT COMMANDS

All instructions are 20 bits, consisting of a leading 4-bit command followed by a 16-bit operand, which depends on the type of command being executed. To input a command, PGC is cycled four times. The commands needed for programming and verification are shown in Table 2-6.

Depending on the 4-bit command, the 16-bit operand represents 16 bits of input data or 8 bits of input data and 8 bits of output data.

Throughout this specification, commands and data are presented as illustrated in Table 2-7. The 4-bit command is shown Most Significant bit (MSb) first. The command operand, or "Data Payload", is shown <MSB><LSB>. Figure 2-16 demonstrates how to serially present a 20-bit command/operand to the device.

2.7.2 CORE INSTRUCTION

The core instruction passes a 16-bit instruction to the CPU core for execution. This is needed to set up registers as appropriate for use with other commands.

TABLE 2-6: COMMANDS FOR PROGRAMMING

Description	4-Bit Command
Core Instruction (Shift in16-bit instruction)	0000
Shift out TABLAT register	0010
Table Read	1000
Table Read, post-increment	1001
Table Read, post-decrement	1010
Table Read, pre-increment	1011
Table Write	1100
Table Write, post-increment by 2	1101
Table Write, start programming, post-increment by 2	1110
Table Write, start programming	1111

3.0 DEVICE PROGRAMMING

Programming includes the ability to erase or write the various memory regions within the device.

In all cases, except high-voltage ICSP Bulk Erase, the EECON1 register must be configured in order to operate on a particular memory region.

When using the EECON1 register to act on code memory, the EEPGD bit must be set (EECON1<7> = 1) and the CFGS bit must be cleared (EECON1<6> = 0). The WREN bit must be set (EECON1<2> = 1) to enable writes of any sort (e.g., erases) and this must be done prior to initiating a write sequence. The FREE bit must be set (EECON1<4> = 1) in order to erase the program space being pointed to by the Table Pointer. The erase or write sequence is initiated by setting the WR bit (EECON1<1> = 1). It is strongly recommended that the WREN bit only be set immediately prior to a program or erase.

3.1 ICSP Erase

3.1.1 HIGH-VOLTAGE ICSP BULK ERASE

Erasing code or data EEPROM is accomplished by configuring two Bulk Erase Control registers located at 3C0004h and 3C0005h. Code memory may be erased portions at a time, or the user may erase the entire device in one action. Bulk Erase operations will also clear any code-protect settings associated with the memory block erased. Erase options are detailed in Table 3-1. If data EEPROM is code-protected (CPD = 0), the user must request an erase of data EEPROM (e.g., 0084h as shown in Table 3-1).

TABLE 3-1: BULK ERASE OPTIONS

Description	Data (3C0005h:3C0004h)
Chip Erase	0F8Fh
Erase User ID	0088h
Erase Data EEPROM	0084h
Erase Boot Block	0081h
Erase Config Bits	0082h
Erase Code EEPROM Block 0	0180h
Erase Code EEPROM Block 1	0280h
Erase Code EEPROM Block 2	0480h
Erase Code EEPROM Block 3	0880h

The actual Bulk Erase function is a self-timed operation. Once the erase has started (falling edge of the 4th PGC after the NOP command), serial execution will cease until the erase completes (parameter P11). During this time, PGC may continue to toggle but PGD must be held low.

The code sequence to erase the entire device is shown in Table 3-2 and the flowchart is shown in Figure 3-1.

Note:	A Bulk Erase is the only way to reprogram code-protect bits from an “on” state to an “off” state.

TABLE 3-2: BULK ERASE COMMAND SEQUENCE

4-Bit Command	Data Payload	Core Instruction
0000	0E 3C	MOVLW 3Ch
0000	6E F8	MOVWF TBLPTRU
0000	0E 00	MOVLW 00h
0000	6E F7	MOVWF TBLPTRH
0000	0E 05	MOVLW 05h
0000	6E F6	MOVWF TBLPTRL
1100	0F 0F	Write 0Fh to 3C0005h
0000	0E 3C	MOVLW 3Ch
0000	6E F8	MOVWF TBLPTRU
0000	0E 00	MOVLW 00h
0000	6E F7	MOVWF TBLPTRH
0000	0E 04	MOVLW 04h
0000	6E F6	MOVWF TBLPTRL
1100	8F 8F	Write 8F8Fh TO 3C0004h to erase entire device.
0000	00 00	NOP
0000	00 00	Hold PGD low until erase completes.

FIGURE 3-1: BULK ERASE FLOW

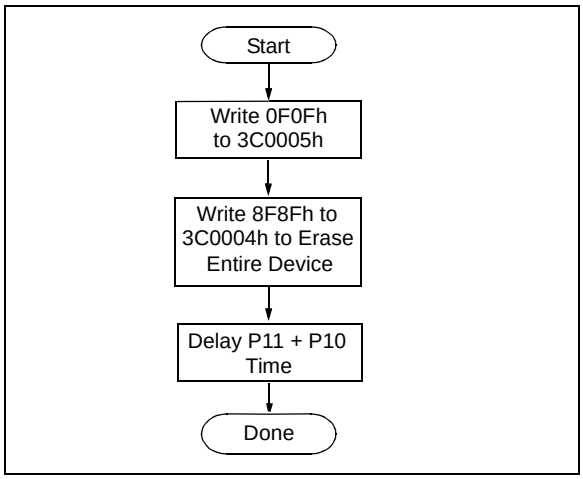

TABLE 3-3: ERASE CODE MEMORY CODE SEQUENCE

4-bit Command	Data Payload	Core Instruction
Step 1: Direct access to code memory and enable writes.		
0000	8E A6	BSF EECON1, EEPGD
0000	9C A6	BCF EECON1, CFGS
0000	84 A6	BSF EECON1, WREN
Step 2: Point to first row in code memory.		
0000	6A F8	CLRF TBLPTRU
0000	6A F7	CLRF TBLPTRH
0000	6A F6	CLRF TBLPTRL
Step 3: Enable erase and erase single row.		
0000	88 A6	BSF EECON1, FREE
0000	82 A6	BSF EECON1, WR
0000	00 00	NOP
0000	00 00	NOP Erase starts on the 4th clock of this instruction
Step 4: Poll WR bit. Repeat until bit is clear.		
0000	50 A6	MOVF EECON1, W, 0
0000	6E F5	MOVWF TABLAT
0000	00 00	NOP
0010	<MSB><LSB>	Shift out data(1)
Step 5: Hold PGC low for time P10.		
Step 6: Repeat step 3 with Address Pointer incremented by 64 until all rows are erased.		
Step 7: Disable writes.		
0000	94 A6	BCF EECON1, WREN

Note 1: See Figure 4-4 for details on shift out data timing.

FIGURE 3-3: SINGLE ROW ERASE CODE MEMORY FLOW

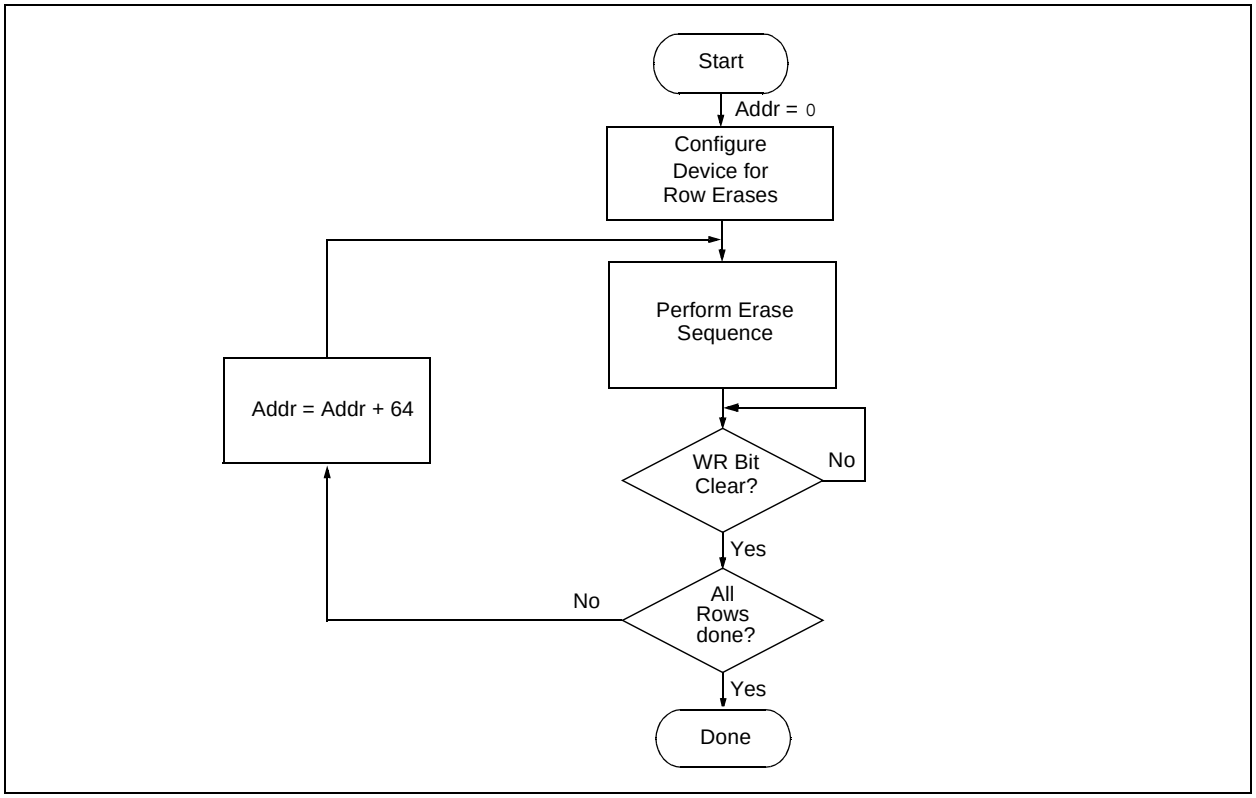

FIGURE 3-4: PROGRAM CODE MEMORY FLOW

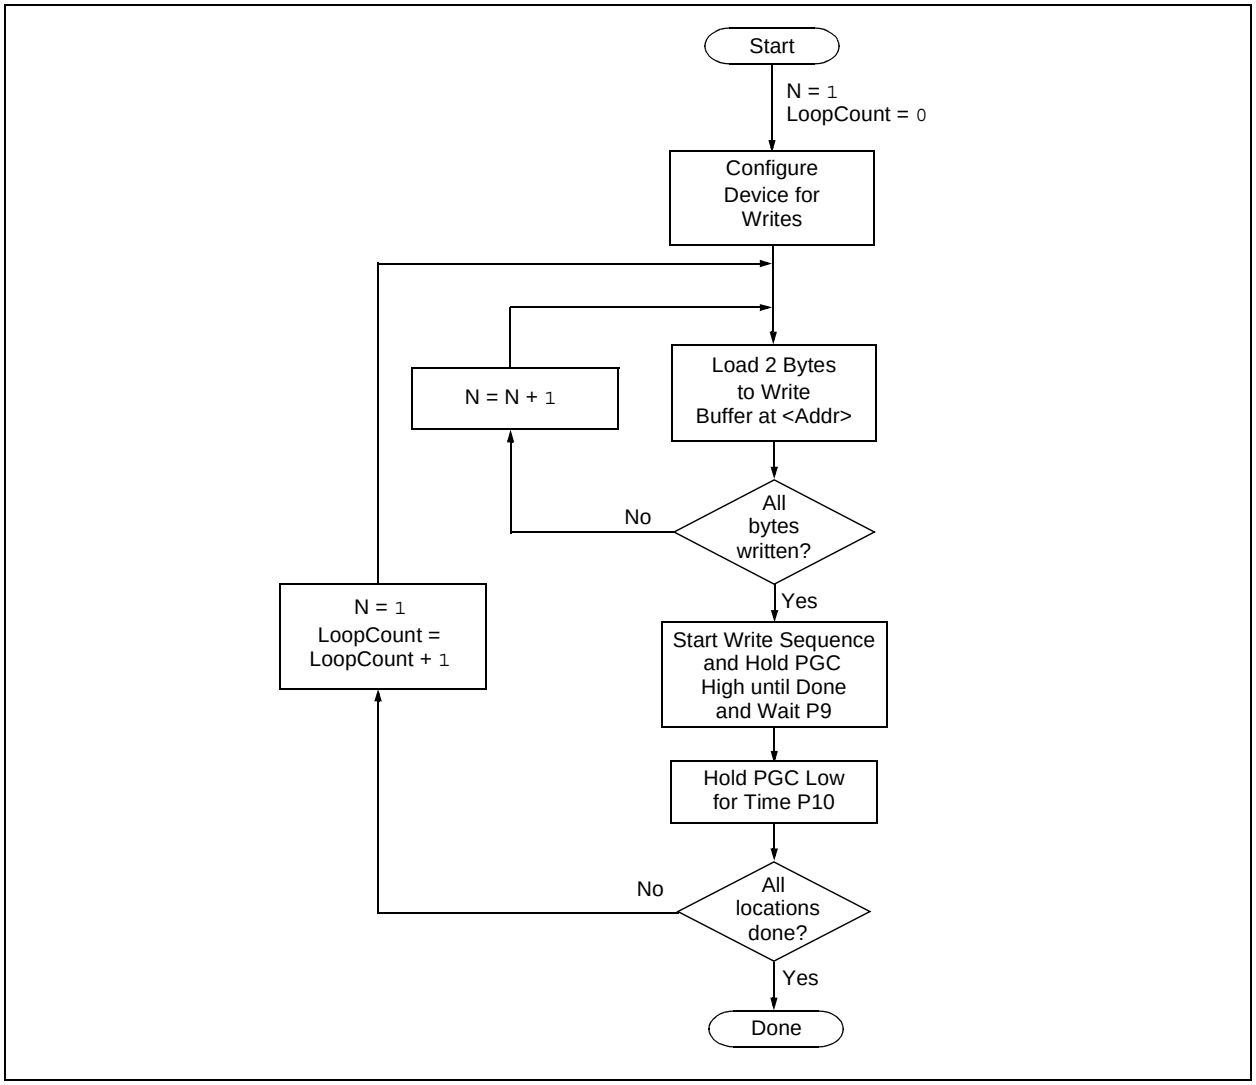

FIGURE 3-5: TABLE WRITE AND START PROGRAMMING INSTRUCTION TIMING DIAGRAM (1111)

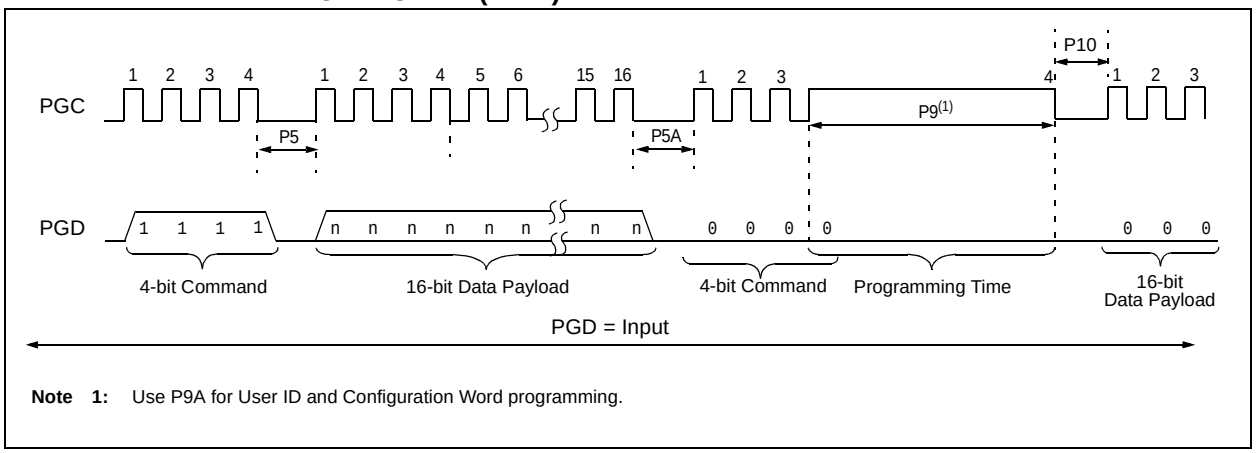

Note 1: Use P9A for User ID and Configuration Word programming.

3.3 Data EEPROM Programming

Data EEPROM is accessed one byte at a time via an Address Pointer (register pair EEADRH:EEADR) and a data latch (EEDATA). Data EEPROM is written by loading EEADRH:EEADR with the desired memory location, EEDATA with the data to be written and initiating a memory write by appropriately configuring the EECON1 register. A byte write automatically erases the location and writes the new data (erase-before-write).

When using the EECON1 register to perform a data EEPROM write, both the EEPGD and CFGS bits must be cleared (EECON1<7:6> = 00). The WREN bit must be set (EECON1<2> = 1) to enable writes of any sort and this must be done prior to initiating a write sequence. The write sequence is initiated by setting the WR bit (EECON1<1> = 1).

The write begins on the falling edge of the 24th PGC after the WR bit is set. It ends when the WR bit is cleared by hardware.

After the programming sequence terminates, PGC must be held low for the time specified by parameter P10 to allow high-voltage discharge of the memory array.

FIGURE 3-6: PROGRAM DATA FLOW

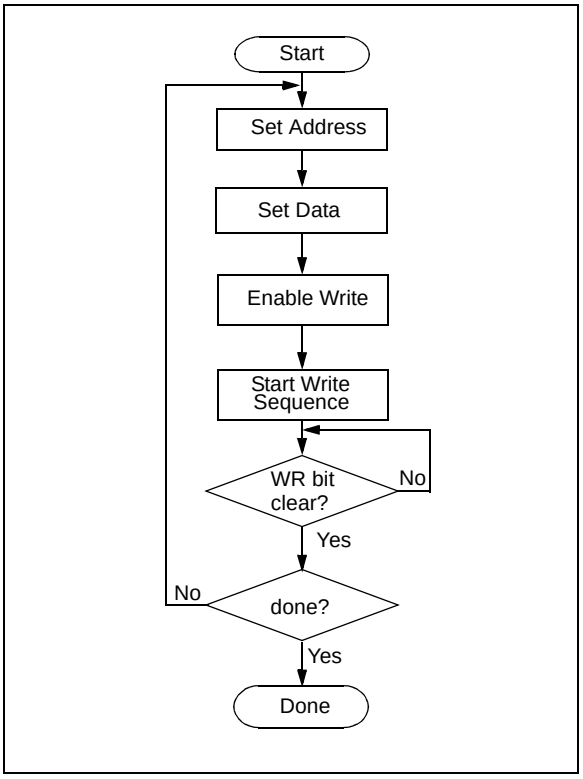

FIGURE 3-7: DATA EEPROM WRITE TIMING DIAGRAM

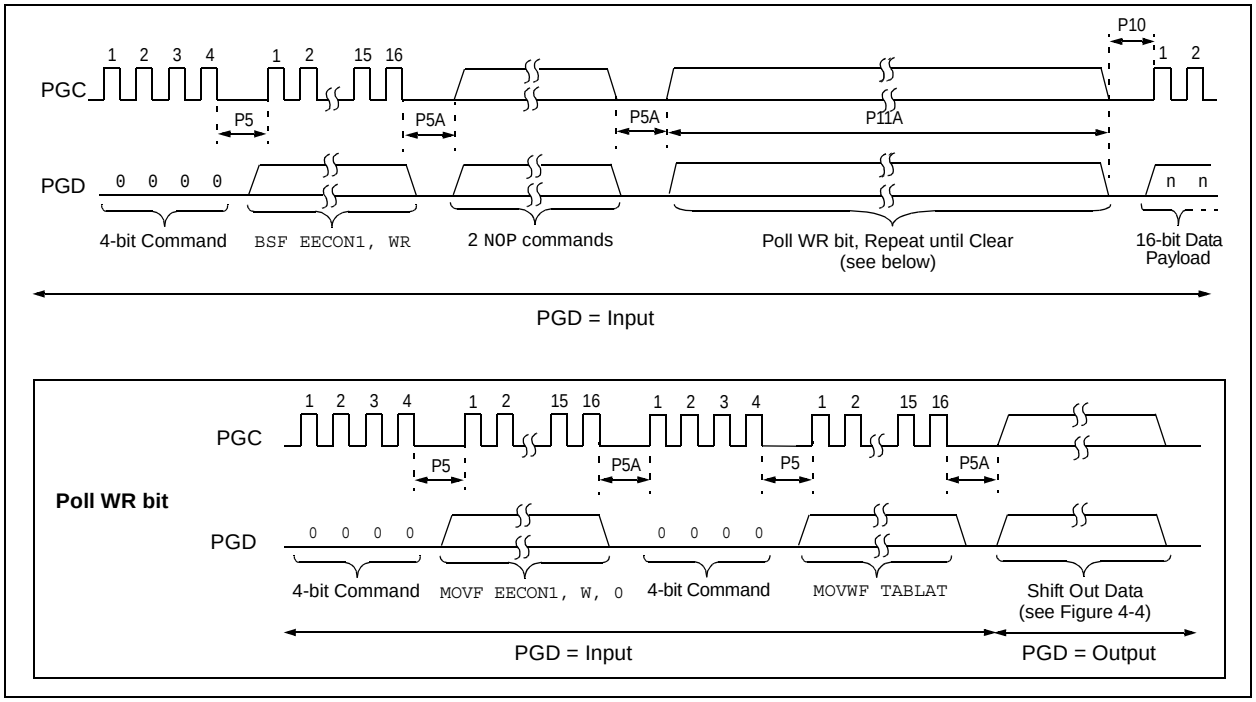

TABLE 3-7: PROGRAMMING DATA MEMORY

4-bit Command	Data Payload	Core Instruction
Step 1: Direct access to data EEPROM.		
0000	9E A6	BCF EECON1, EEPGD
0000	9C A6	BCF EECON1, CFGS
Step 2: Set the data EEPROM Address Pointer.		
0000	0E <Addr>	MOVLW <Addr>
0000	6E A9	MOVWF EEADR
0000	OE <AddrH>	MOVLW <AddrH>
0000	6E AA	MOVWF EEADRH
Step 3: Load the data to be written.		
0000	0E <Data>	MOVLW <Data>
0000	6E A8	MOVWF EEDATA
Step 4: Enable memory writes.		
0000	84 A6	BSF EECON1, WREN
Step 5: Initiate write.		
0000	82 A6	BSF EECON1, WR
0000	00 00	NOP
0000	00 00	NOP ;write starts on 4th clock of this instruction
Step 6: Poll WR bit, repeat until the bit is clear.		
0000	50 A6	MOVF EECON1, W, 0
0000	6E F5	MOVWF TABLAT
0000	00 00	NOP
0010	<MSB><LSB>	Shift out data(1)
Step 7: Hold PGC low for time P10.		
Step 8: Disable writes.		
0000	94 A6	BCF EECON1, WREN
Repeat steps 2 through 8 to write more data.		

Note 1: See Figure 4-4 for details on shift out data timing.

3.4 ID Location Programming

The ID locations are programmed much like the code memory. The ID registers are mapped in addresses 200000h through 200007h. These locations read out normally even after code protection.

Note:	The user only needs to fill the first 8 bytes of the write buffer in order to write the ID locations.

Table 3-8 demonstrates the code sequence required to write the ID locations.

In order to modify the ID locations, refer to the methodology described in **Section 3.2.1 "Modifying Code Memory"**. As with code memory, the ID locations must be erased before being modified.

When VDD is below the minimum for Bulk Erase operation, ID locations can be cleared with the Row Erase method described in **Section 3.1.3 "ICSP Row Erase"**.

TABLE 3-8: WRITE ID SEQUENCE

4-bit Command	Data Payload	Core Instruction
Step 1: Direct access to code memory.		
0000	8E A6	BSF EECON1, EEPGD
0000	9C A6	BCF EECON1, CFGS
0000	84 A6	BSF EECON1, WREN
Step 2: Set Table Pointer to ID. Load write buffer with 8 bytes and write.		
0000	0E 20	MOVLW 20h
0000	6E F8	MOVWF TBLPTRU
0000	0E 00	MOVLW 00h
0000	6E F7	MOVWF TBLPTRH
0000	0E 00	MOVLW 00h
0000	6E F6	MOVWF TBLPTRL
1101	<MSB><LSB>	Write 2 bytes and post-increment address by 2.
1101	<MSB><LSB>	Write 2 bytes and post-increment address by 2.
1101	<MSB><LSB>	Write 2 bytes and post-increment address by 2.
1111	<MSB><LSB>	Write 2 bytes and start programming.
0000	00 00	NOP - hold PGC high for time P9 and low for time P10.

3.5 Boot Block Programming

The code sequence detailed in Table 3-5 should be used, except that the address used in “Step 2” will be in the range of 000000h to 0007FFh.

3.6 Configuration Bits Programming

Unlike code memory, the Configuration bits are programmed a byte at a time. The Table Write, Begin Programming 4-bit command (‘1111’) is used, but only 8 bits of the following 16-bit payload will be written. The LSB of the payload will be written to even addresses and the MSB will be written to odd addresses. The code sequence to program two consecutive configuration locations is shown in Table 3-9. See Figure 3-5 for the timing diagram.

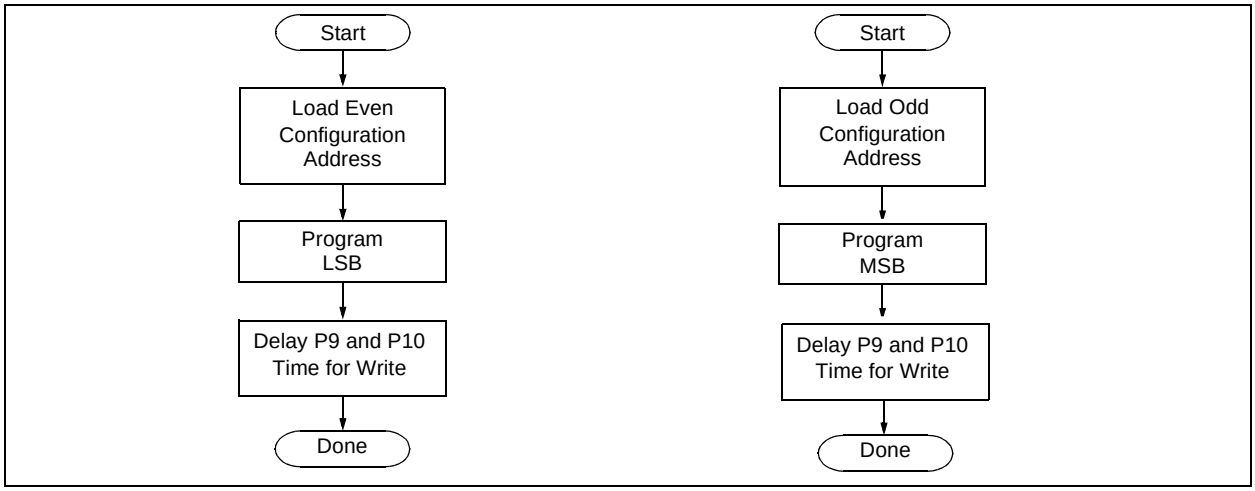
Note:	The address must be explicitly written for each byte programmed. The addresses can not be incremented in this mode.

TABLE 3-9: SET ADDRESS POINTER TO CONFIGURATION LOCATION

4-bit Command	Data Payload	Core Instruction
Step 1: Direct access to config memory.		
0000	8E A6	BSF EECON1, EEPGD
0000	8C A6	BSF EECON1, CFGS
0000	84 A6	BSF EECON1, WREN
Step 2(1): Set Table Pointer for config byte to be written. Write even/odd addresses.		
0000	0E 30	MOVLW 30h
0000	6E F8	MOVWF TBLPTRU
0000	0E 00	MOVLW 00h
0000	6E F7	MOVWF TBLPRTH
0000	0E 00	MOVLW 00h
0000	6E F6	MOVWF TBLPTRL
1111	<MSB ignored><LSB>	Load 2 bytes and start programming.
0000	00 00	NOP - hold PGC high for time P9 and low for time P10.
0000	0E 01	MOVLW 01h
0000	6E F6	MOVWF TBLPTRL
1111	<MSB><LSB ignored>	Load 2 bytes and start programming.
0000	00 00	NOP - hold PGC high for time P9A and low for time P10.

Note 1: Enabling the write protection of Configuration bits (WRTC = 0 in CONFIG6H) will prevent further writing of Configuration bits. Always write all the Configuration bits before enabling the write protection for Configuration bits.

FIGURE 3-8: CONFIGURATION PROGRAMMING FLOW

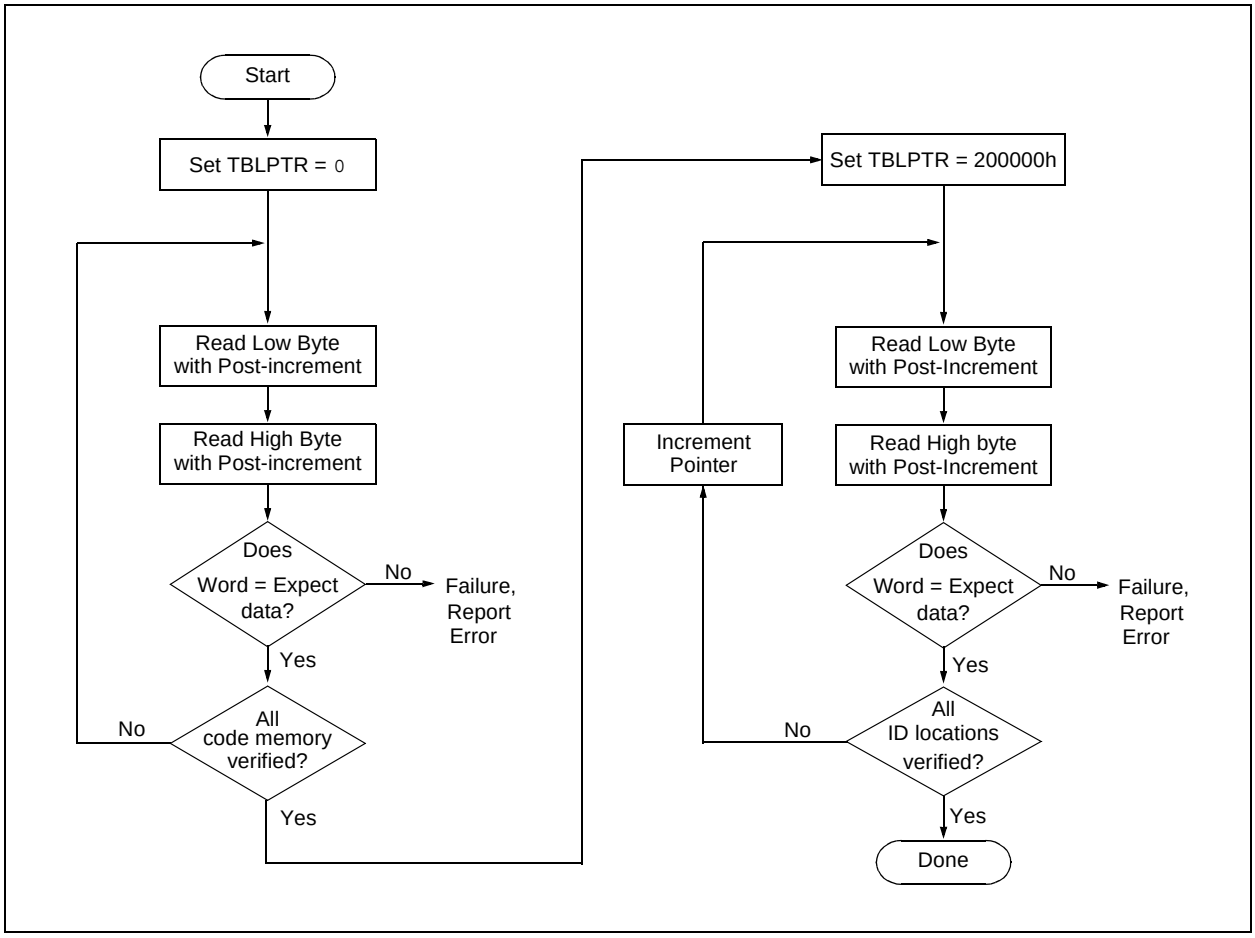


4.2 Verify Code Memory and ID Locations

The verify step involves reading back the code memory space and comparing it against the copy held in the programmer's buffer. Memory reads occur a single byte at a time, so two bytes must be read to compare against the word in the programmer's buffer. Refer to **Section 4.1 "Read Code Memory, ID Locations and Configuration Bits"** for implementation details of reading code memory.

The Table Pointer must be manually set to 200000h (base address of the ID locations) once the code memory has been verified. The post-increment feature of the table read 4-bit command can not be used to increment the Table Pointer beyond the code memory space. In a 64-Kbyte device, for example, a post-increment read of address FFFFh will wrap the Table Pointer back to 000000h, rather than point to unimplemented address 010000h.

FIGURE 4-2: VERIFY CODE MEMORY FLOW



4.3 Verify Configuration Bits

A configuration address may be read and output on PGD via the 4-bit command, '1001'. Configuration data is read and written in a byte-wise fashion, so it is not necessary to merge two bytes into a word prior to a compare. The result may then be immediately compared to the appropriate configuration data in the programmer's memory for verification. Refer to **Section 4.1 "Read Code Memory, ID Locations and Configuration Bits"** for implementation details of reading configuration data.

4.4 Read Data EEPROM Memory

Data EEPROM is accessed one byte at a time via an Address Pointer (register pair EEADRH:EEADR) and a data latch (EEDATA). Data EEPROM is read by loading EEADRH:EEADR with the desired memory location and initiating a memory read by appropriately configuring the EECON1 register. The data will be loaded into EEDATA, where it may be serially output on PGD via the 4-bit command, '0010' (Shift Out Data Holding register). A delay of P6 must be introduced after the falling edge of the 8th PGC of the operand to allow PGD to transition from an input to an output. During this time, PGC must be held low (see Figure 4-4).

The command sequence to read a single byte of data is shown in Table 4-2.

FIGURE 4-3: READ DATA EEPROM FLOW

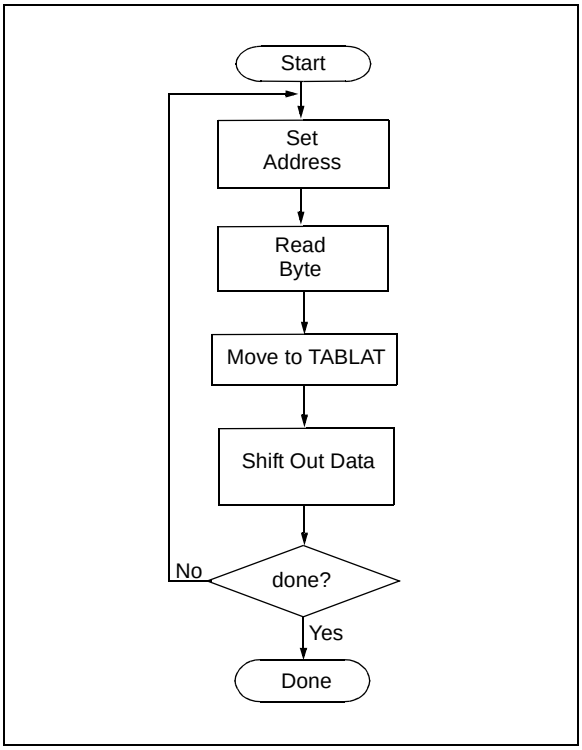


TABLE 4-2: READ DATA EEPROM MEMORY

4-bit Command	Data Payload	Core Instruction
Step 1: Direct access to data EEPROM.		
0000	9E A6	BCF EECON1, EEPGD
0000	9C A6	BCF EECON1, CFGS
Step 2: Set the data EEPROM Address Pointer.		
0000	0E <Addr>	MOVLW <Addr>
0000	6E A9	MOVWF EEADR
0000	OE <AddrH>	MOVLW <AddrH>
0000	6E AA	MOVWF EEADRH
Step 3: Initiate a memory read.		
0000	80 A6	BSF EECON1, RD
Step 4: Load data into the Serial Data Holding register.		
0000	50 A8	MOVF EEDATA, W, 0
0000	6E F5	MOVWF TABLAT
0000	00 00	NOP
0010	<MSB><LSB>	Shift Out Data(1)

Note 1: The <LSB> is undefined. The <MSB> is the data.

TABLE 5-2: DEVICE ID VALUE

Device	Device ID Value	
	DEVID2	DEVID1
PIC18F23K20	20h	111x xxxx
PIC18F24K20	20h	101x xxxx
PIC18F25K20	20h	011x xxxx

P1	TR	MCLR/VPP/RE3 Rise Time to enter Program/Verify mode	—	1.0	μs	**(Note 1)**
P2	TPGC	Serial Clock (PGC) Period	100	—	ns	VDD = 3.6V
			1	—	μs	VDD = 1.8V
P2A	TPGCL	Serial Clock (PGC) Low Time	40	—	ns	VDD = 3.6V
			400	—	ns	VDD = 1.8V
P2B	TPGCH	Serial Clock (PGC) High Time	40	—	ns	VDD = 3.6V
			400	—	ns	VDD = 1.8V
P3	TSET1	Input Data Setup Time to Serial Clock ↓	15	—	ns	
P4	THLD1	Input Data Hold Time from PGC ↓	15	—	ns	
P5	TDLY1	Delay between 4-bit Command and Command Operand	40	—	ns	
P5A	TDLY1A	Delay between 4-bit Command Operand and next 4-bit Command	40	—	ns	
P6	TDLY2	Delay between Last PGC ↓ of Command Byte to First PGC ↑ of Read of Data Word	20	—	ns	
P9	TDLY5	PGC High Time (minimum programming time)	1	—	ms	Externally Timed
P9A	TDLY5A	PGC High Time	5		ms	Configuration Word programming time
P10	TDLY6	PGC Low Time after Programming (high-voltage discharge time)	200	—	μs	
P11	TDLY7	Delay to allow Self-Timed Data Write or Bulk Erase to occur	5	—	ms	
P11A	TDRWT	Data Write Polling Time	4	—	ms	

Note 1: Do not allow excess time when transitioning MCLR between VIL and VIHH; this can cause spurious program executions to occur. The maximum transition time is:
1 TCY + TPWRT (if enabled) + 1024 TOSC (for LP, HS, HS/PLL and XT modes only) + 2 ms (for HS/PLL mode only) + 1.5 μs (for EC mode only) where TCY is the instruction cycle time, TPWRT is the Power-up Timer period and TOSC is the oscillator period. For specific values, refer to the Electrical Characteristics section of the device data sheet for the particular device.

6.0 AC/DC CHARACTERISTICS TIMING REQUIREMENTS FOR PROGRAM/ VERIFY TEST MODE (CONTINUED)

Standard Operating Conditions
Operating Temperature: 25°C is recommended

Param No.	Sym.	Characteristic	Min.	Max.	Units	Conditions
P12	THLD2	Input Data Hold Time from $\overline{MCLR}$/VPP/RE3 ↑	2	—	µs	
P13	TSET2	VDD ↑ Setup Time to $\overline{MCLR}$/VPP/RE3 ↑	100	—	ns	
P14	TVALID	Data Out Valid from PGC ↑	10	—	ns	
P15	TSET3	PGM ↑ Setup Time to $\overline{MCLR}$/VPP/RE3 ↑	2	—	µs	
P16	TDLY8	Delay between Last PGC ↓ and $\overline{MCLR}$/VPP/RE3 ↓	0	—	s	
P17	THLD3	$\overline{MCLR}$/VPP/RE3 ↓ to VDD ↓	—	100	ns	
P18	THLD4	$\overline{MCLR}$/VPP/RE3 ↓ to PGM ↓	0	—	s	
P19	THIZ	Delay from PGC ↑ to PGD High-Z	3	10	nS	
P20	TPPDP	Hold time after VPP changes	5	—	µs	

Note 1: Do not allow excess time when transitioning $\overline{MCLR}$ between VIL and VIHH; this can cause spurious program executions to occur. The maximum transition time is:
1 TCY + TPWRT (if enabled) + 1024 TOSC (for LP, HS, HS/PLL and XT modes only) + 2 ms (for HS/PLL mode only) + 1.5 µs (for EC mode only) where TCY is the instruction cycle time, TPWRT is the Power-up Timer period and TOSC is the oscillator period. For specific values, refer to the Electrical Characteristics section of the device data sheet for the particular device.

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Trademarks

Microchip received ISO/TS-16949:2002 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
