

Welcome to E-XFL.COM

#### What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

#### Applications of "<u>Embedded -</u> <u>Microcontrollers</u>"

#### Details

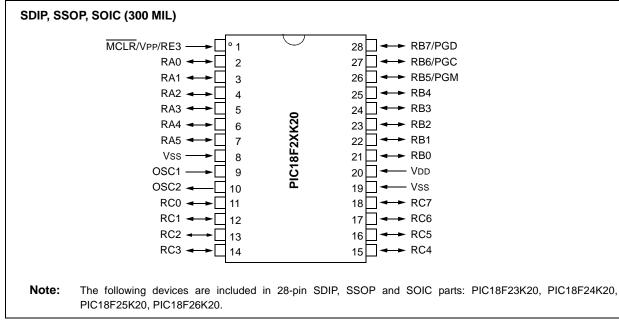

Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	64MHz
Connectivity	I <sup>2</sup> C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, HLVD, POR, PWM, WDT
Number of I/O	35
Program Memory Size	64KB (32K x 16)
Program Memory Type	FLASH
EEPROM Size	1K x 8
RAM Size	3.8K x 8
Voltage - Supply (Vcc/Vdd)	1.8V ~ 3.6V
Data Converters	A/D 14x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	44-VQFN Exposed Pad
Supplier Device Package	44-QFN (8×8)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic18f46k20-i-ml

Email: info@E-XFL.COM

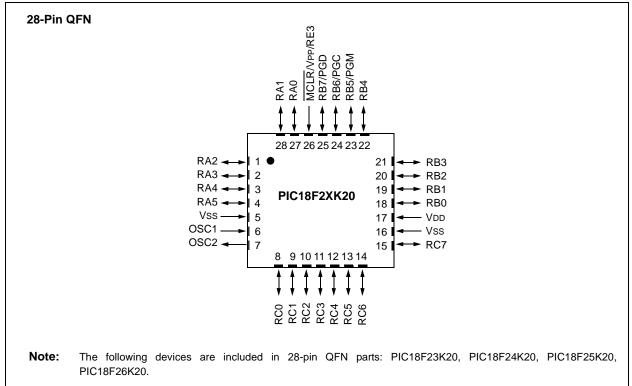

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

# PIC18F2XK20/4XK20

#### FIGURE 2-1: 28-PIN SDIP, SSOP AND SOIC PIN DIAGRAMS

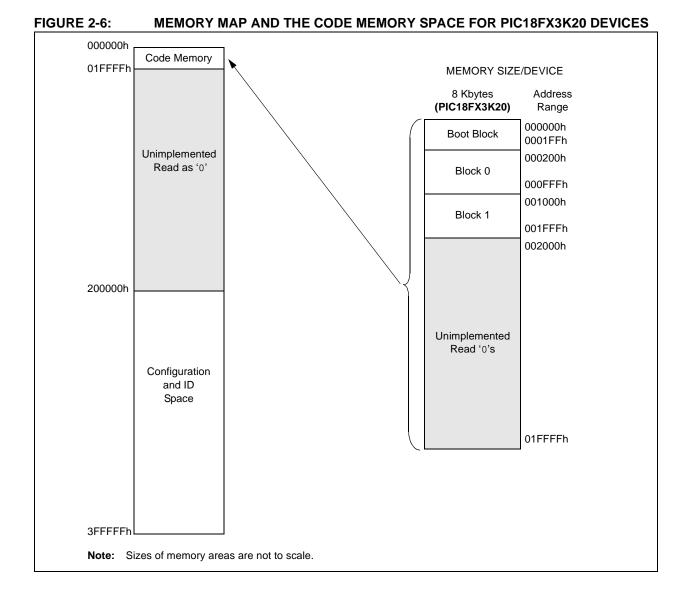

#### 2.3 Memory Maps

For the PIC18FX3K20 devices, the code memory space extends from 0000h to 01FFFh (8 Kbytes) in two 4-Kbyte blocks. Addresses 0000h through 01FFh, however, define a "Boot Block" region that is treated separately from Block 0. All of these blocks define code protection boundaries within the code memory space.

## TABLE 2-2:IMPLEMENTATION OF CODE<br/>MEMORY

Device	Code Memory Size (Bytes)
PIC18F23K20	
PIC18F43K20	000000h-001FFFh (8K)

For PIC18FX5K20 devices, the code memory space extends from 000000h to 007FFFh (32 Kbytes) in four 8-Kbyte blocks. Addresses 000000h through 0007FFh, however, define a "Boot Block" region that is treated separately from Block 0. All of these blocks define code protection boundaries within the code memory space.

## TABLE 2-4:IMPLEMENTATION OF CODE<br/>MEMORY

Device	Code Memory Size (Bytes)	
PIC18F25K20	000000h 007EEEh (22K)	
PIC18F45K20	000000h-007FFFh (32K)	

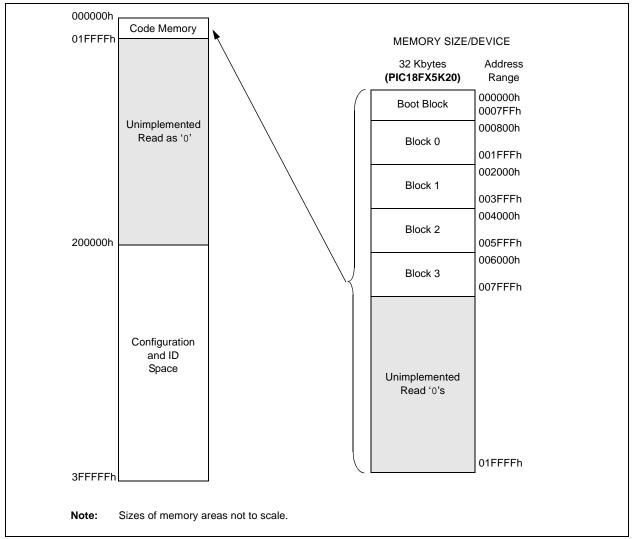

FIGURE 2-8: MEMORY MAP AND THE CODE MEMORY SPACE FOR PIC18FX5K20 DEVICES

© 2009 Microchip Technology Inc.

In addition to the code memory space, there are three blocks in the configuration and ID space that are accessible to the user through table reads and table writes. Their locations in the memory map are shown in Figure 2-10.

Users may store identification information (ID) in eight ID registers. These ID registers are mapped in addresses 200000h through 200007h. The ID locations read out normally, even after code protection is applied.

Locations 300000h through 30000Dh are reserved for the Configuration bits. These bits select various device options and are described in **Section 5.0 "Configuration Word**". These Configuration bits read out normally, even after code protection.

Locations 3FFFFEh and 3FFFFFh are reserved for the device ID bits. These bits may be used by the programmer to identify what device type is being programmed and are described in **Section 5.0** "**Configuration Word**". These device ID bits read out normally, even after code protection.

#### 2.3.1 MEMORY ADDRESS POINTER

Memory in the address space, 0000000h to 3FFFFh, is addressed via the Table Pointer register, which is comprised of three Pointer registers:

- TBLPTRU, at RAM address 0FF8h
- TBLPTRH, at RAM address 0FF7h
- TBLPTRL, at RAM address 0FF6h

TBLPTRU	TBLPTRH	TBLPTRL
Addr[21:16]	Addr[15:8]	Addr[7:0]

The 4-bit command, '0000' (core instruction), is used to load the Table Pointer prior to using any read or write operations.

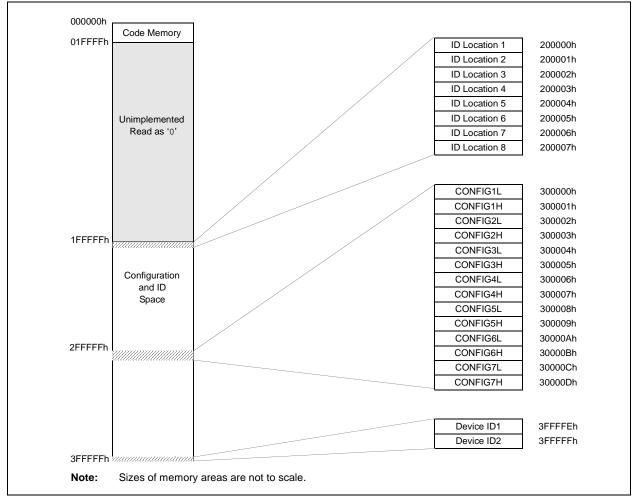

FIGURE 2-10: CONFIGURATION AND ID LOCATIONS FOR PIC18F2XK20/4XK20 DEVICES

## 3.0 DEVICE PROGRAMMING

Programming includes the ability to erase or write the various memory regions within the device.

In all cases, except high-voltage ICSP Bulk Erase, the EECON1 register must be configured in order to operate on a particular memory region.

When using the EECON1 register to act on code memory, the EEPGD bit must be set (EECON1<7> = 1) and the CFGS bit must be cleared (EECON1<6> = 0). The WREN bit must be set (EECON1<2> = 1) to enable writes of any sort (e.g., erases) and this must be done prior to initiating a write sequence. The FREE bit must be set (EECON1<4> = 1) in order to erase the program space being pointed to by the Table Pointer. The erase or write sequence is initiated by setting the WR bit (EECON1<1> = 1). It is strongly recommended that the WREN bit only be set immediately prior to a program or erase.

## 3.1 ICSP Erase

#### 3.1.1 HIGH-VOLTAGE ICSP BULK ERASE

Erasing code or data EEPROM is accomplished by configuring two Bulk Erase Control registers located at 3C0004h and 3C0005h. Code memory may be erased portions at a time, or the user may erase the entire device in one action. Bulk Erase operations will also clear any code-protect settings associated with the memory block erased. Erase options are detailed in Table 3-1. If data EEPROM is code-protected (CPD = 0), the user must request an erase of data EEPROM (e.g., 0084h as shown in Table 3-1).

Description	Data (3C0005h:3C0004h)
Chip Erase	0F8Fh
Erase User ID	0088h
Erase Data EEPROM	0084h
Erase Boot Block	0081h
Erase Config Bits	0082h
Erase Code EEPROM Block 0	0180h
Erase Code EEPROM Block 1	0280h
Erase Code EEPROM Block 2	0480h
Erase Code EEPROM Block 3	0880h

TABLE 3-1: BULK ERASE OPTIONS

The actual Bulk Erase function is a self-timed operation. Once the erase has started (falling edge of the 4th PGC after the NOP command), serial execution will cease until the erase completes (parameter P11). During this time, PGC may continue to toggle but PGD must be held low.

The code sequence to erase the entire device is shown in Table 3-2 and the flowchart is shown in Figure 3-1.

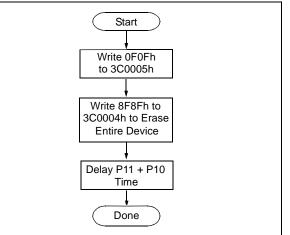

Note: A Bulk Erase is the only way to reprogram code-protect bits from an "on" state to an "off" state.

## TABLE 3-2: BULK ERASE COMMAND SEQUENCE

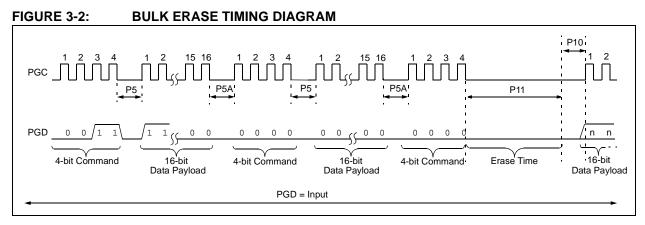

4-Bit	Data	
Command	Payload	Core Instruction
0000	0E 3C	MOVLW 3Ch
0000	6E F8	MOVWF TBLPTRU
0000	0E 00	MOVLW 00h
0000	6E F7	MOVWF TBLPTRH
0000	0E 05	MOVLW 05h
0000	6E F6	MOVWF TBLPTRL
1100	0F 0F	Write OFh to 3C0005h
0000	0E 3C	MOVLW 3Ch
0000	6E F8	MOVWF TBLPTRU
0000	0E 00	MOVLW 00h
0000	6E F7	MOVWF TBLPTRH
0000	0E 04	MOVLW 04h
0000	6E F6	MOVWF TBLPTRL
1100	8F 8F	Write 8F8Fh TO 3C0004h to erase entire device.
0000	00 00	NOP
0000	00 00	Hold PGD low until erase completes.

#### FIGURE 3-1:

**BULK ERASE FLOW** 

# PIC18F2XK20/4XK20

#### 3.1.2 LOW-VOLTAGE ICSP BULK ERASE

When using low-voltage ICSP, the part must be supplied by the voltage specified in parameter D111 if a Bulk Erase is to be executed. All other Bulk Erase details as described above apply.

If it is determined that a program memory erase must be performed at a supply voltage below the Bulk Erase limit, refer to the erase methodology described in Section 3.1.3 "ICSP Row Erase" and Section 3.2.1 "Modifying Code Memory".

If it is determined that a data EEPROM erase must be performed at a supply voltage below the Bulk Erase limit, follow the methodology described in **Section 3.3** "**Data EEPROM Programming**" and write '1's to the array.

## 3.1.3 ICSP ROW ERASE

Regardless of whether high or low-voltage ICSP is used, it is possible to erase one row (64 bytes of data), provided the block is not code or write-protected. Rows are located at static boundaries beginning at program memory address 000000h, extending to the internal program memory limit (see **Section 2.3 "Memory Maps"**).

The Row Erase duration is self-timed. After the WR bit in EECON1 is set, two NOPs are issued. Erase starts upon the 4th PGC of the second NOP. It ends when the WR bit is cleared by hardware.

The code sequence to Row Erase a PIC18F2XK20/ 4XK20 device is shown in Table 3-3. The flowchart shown in Figure 3-3 depicts the logic necessary to completely erase a PIC18F2XK20/4XK20 device. The timing diagram for Row Erase is identical to the data EEPROM write timing shown in Figure 3-7.

**Note:** The TBLPTR register can point at any byte within the row intended for erase.

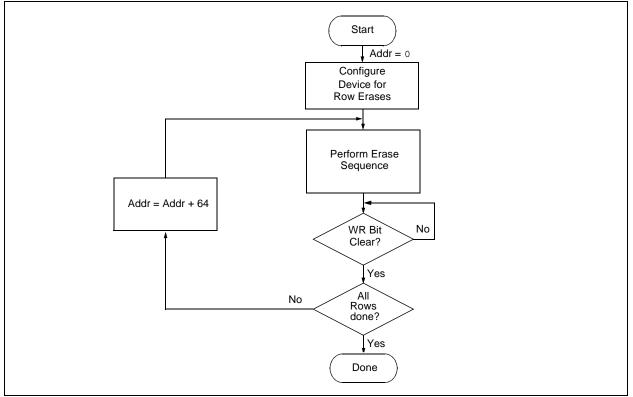

4-bit CommandData PayloadStep 1: Direct access to code memory and enable writes.00008E A600009C A600009C A6000084 A6000085FStep 2: Point to First row in code memory.	Core Instruction

# PIC18F2XK20/4XK20

## 3.2 Code Memory Programming

Programming code memory is accomplished by first loading data into the write buffer and then initiating a programming sequence. The write and erase buffer sizes shown in Table 3-4 can be mapped to any location of the same size beginning at 000000h. The actual memory write sequence takes the contents of this buffer and programs the proper amount of code memory that contains the Table Pointer.

The programming duration is externally timed and is controlled by PGC. After a Start Programming command is issued (4-bit command, '1111'), a NOP is issued, where the 4th PGC is held high for the duration of the programming time, P9.

After PGC is brought low, the programming sequence is terminated. PGC must be held low for the time specified by parameter P10 to allow high-voltage discharge of the memory array.

The code sequence to program a PIC18F2XK20/ 4XK20 device is shown in Table 3-5. The flowchart shown in Figure 3-4 depicts the logic necessary to completely write a PIC18F2XK20/4XK20 device. The timing diagram that details the Start Programming command and parameters P9 and P10 is shown in Figure 3-5.

Note: The TBLPTR register must point to the same region when initiating the programming sequence as it did when the write buffers were loaded.

Devices (Arranged by Family)	Write Buffer Size (bytes)	Erase Size (bytes)
PIC18F26K20, PIC18F46K20	64	64
PIC18F24K20, PIC18F25K20, PIC18F44K20, PIC18F45K20	32	64
PIC18F23K20, PIC18F43K20	16	64

4-bit Command	Data Payload	Core Instruction	
Step 1: Direct access to code memory.			
0000 0000 0000	8E A6 9C A6 84 A6	BSF EECON1, EEPGD BCF EECON1, CFGS BSF EECON1, WREN

Step 3: Load wr	Step 3: Load write buffer. Repeat for all but the last two bytes.		
1101	<msb><lsb></lsb></msb>	Write 2 bytes and post-increment address by 2.	
Step 4: Load write buffer for last two bytes and start programming.			
1111 0000	<msb><lsb> 00 00</lsb></msb>	Write 2 bytes and start programming. NOP - hold PGC high for time P9 and low for time P10.	
To continue writing data, repeat steps 2 through 4, where the Address Pointer is incremented by 2 at each iteration o the loop.			

#### TABLE 3-5: WRITE CODE MEMORY CODE SEQUENCE

#### 3.2.1 MODIFYING CODE MEMORY

The previous programming example assumed that the device has been Bulk Erased prior to programming (see **Section 3.1.1 "High-Voltage ICSP Bulk Erase"**). It may be the case, however, that the user wishes to modify only a section of an already programmed device.

The appropriate number of bytes required for the erase buffer must be read out of code memory (as described in **Section 4.2 "Verify Code Memory and ID Locations**") and buffered. Modifications can be made on this buffer. Then, the block of code memory that was read out must be erased and rewritten with the modified data.

The WREN bit must be set if the WR bit in EECON1 is used to initiate a write sequence.

4-bit Command	Data Payload	Core Instruction	
Step 1: Direct access to code memory.			
0000	8E A6	BSF EECON1, EEPGD	
0000	9C A6	BCF EECON1, CFGS	
Step 2: Read code memory into buffer (Section 4.1 "Read Code Memory, ID Locations and Configuration Bits").			
Step 3: Set the Ta	ble Pointer for the block to b	pe erased.

#### TABLE 3-7: PROGRAMMING DATA MEMORY

Note 1: See Figure 4-4 for details on shift out data timing.

#### 3.5 Boot Block Programming

The code sequence detailed in Table 3-5 should be used, except that the address used in "Step 2" will be in the range of 000000h to 0007FFh.

#### 3.6 Configuration Bits Programming

Unlike code memory, the Configuration bits are programmed a byte at a time. The Table Write, Begin Programming 4-bit command ('1111') is used, but only 8 bits of the following 16-bit payload will be written. The LSB of the payload will be written to even addresses and the MSB will be written to odd addresses. The code sequence to program two consecutive configuration locations is shown in Table 3-9. See Figure 3-5 for the timing diagram.

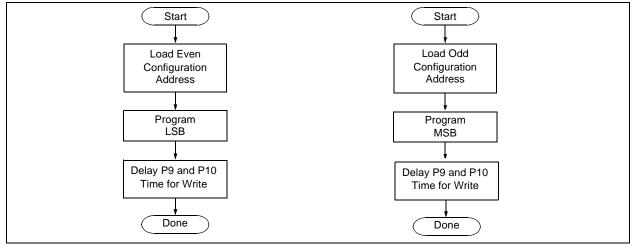

Note: The address must be explicitly written for each byte programmed. The addresses can not be incremented in this mode.

#### TABLE 3-9: SET ADDRESS POINTER TO CONFIGURATION LOCATION

4-bit Command	Data Payload	Core Instruction				
Step 1: Direct a	ccess to config memory.					
0000	8E A6	BSF EECON1, EEPGD				
0000	8C A6	BSF EECON1, CFGS				
0000	84 A6	BSF EECON1, WREN

0000	0E 30	MOVLW 30h				
0000	6E F8	MOVWF TBLPTRU				
0000	0E 00	MOVLW 00h				
0000	6E F7	MOVWF TBLPRTH				
0000	0E 00	MOVLW 00h				
0000	6E F6	MOVWF TBLPTRL				
1111	<msb ignored=""><lsb></lsb></msb>	Load 2 bytes and start programming.				
0000	00 00	NOP - hold PGC high for time P9 and low for time P10.				
0000	0E 01	MOVLW 01h				
0000	6E F6	MOVWF TBLPTRL				
1111	<msb><lsb ignored=""></lsb></msb>	Load 2 bytes and start programming.				
0000	00 00	NOP - hold PGC high for time P9A and low for time P10.				

**Note 1:** Enabling the write protection of Configuration bits (WRTC = 0 in CONFIG6H) will prevent further writing of Configuration bits. Always write all the Configuration bits before enabling the write protection for Configuration bits.

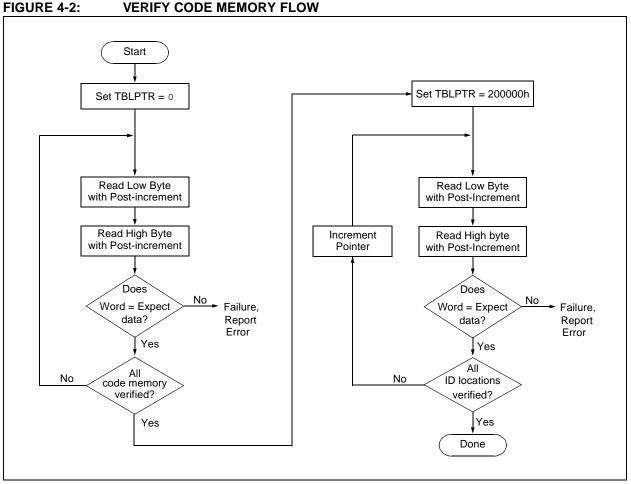

#### FIGURE 3-8: CONFIGURATION PROGRAMMING FLOW

#### 4.2 Verify Code Memory and ID Locations

The verify step involves reading back the code memory space and comparing it against the copy held in the programmer's buffer. Memory reads occur a single byte at a time, so two bytes must be read to compare against the word in the programmer's buffer. Refer to Section 4.1 "Read Code Memory, ID Locations and Configuration Bits" for implementation details of reading code memory.

The Table Pointer must be manually set to 200000h (base address of the ID locations) once the code memory has been verified. The post-increment feature of the table read 4-bit command can not be used to increment the Table Pointer beyond the code memory space. In a 64-Kbyte device, for example, a post-increment read of address FFFFh will wrap the Table Pointer back to 000000h, rather than point to unimplemented address 010000h.

#### 4.3 Verify Configuration Bits

A configuration address may be read and output on PGD via the 4-bit command, '1001'. Configuration data is read and written in a byte-wise fashion, so it is not necessary to merge two bytes into a word prior to a compare. The result may then be immediately compared to the appropriate configuration data in the programmer's memory for verification. Refer to **Section 4.1 "Read Code Memory, ID Locations and Configuration Bits"** for implementation details of reading configuration data.

#### 4.4 Read Data EEPROM Memory

Data EEPROM is accessed one byte at a time via an Address Pointer (register pair EEADRH:EEADR) and a data latch (EEDATA). Data EEPROM is read by loading EEADRH:EEADR with the desired memory location and initiating a memory read by appropriately configuring the EECON1 register. The data will be loaded into EEDATA, where it may be serially output on PGD via the 4-bit command, '0010' (Shift Out Data Holding register). A delay of P6 must be introduced after the falling edge of the 8th PGC of the operand to allow PGD to transition from an input to an output. During this time, PGC must be held low (see Figure 4-4).

The command sequence to read a single byte of data is shown in Table 4-2.

4-bit Command	Data Payload	Core Instruction			
Step 1: Direct acc	ess to data EEPROM.

### TABLE 5-3:PIC18F2XK20/4XK20 BIT DESCRIPTIONS

Bit Name	Configuration Words	Description
WDTEN	CONFIG2H	Watchdog Timer Enable bit
		1 = WDT enabled
		0 = WDT disabled (control is placed on SWDTEN bit)
MCLRE	CONFIG3H	MCLR Pin Enable bit
		1 = MCLR pin enabled, RE3 input pin disabled
		0 = RE3 input pin enabled, MCLR pin disabled
HFOFST	CONFIG3H	HFINTOSC Fast Start
		1 = HFINTOSC output is not delayed
		0 = HFINTOSC output is delayed until oscillator is stable (IOFS = 1)
LPT1OSC	CONFIG3H	Low-Power Timer1 Oscillator Enable bit
		1 = Timer1 configured for low-power operation
		0 = Timer1 configured for higher power operation
PBADEN	CONFIG3H	PORTB A/D Enable bit
		1 = PORTB A/D<4:0> pins are configured as analog input channels on Reset
		0 = PORTB A/D<4:0> pins are configured as digital I/O on Reset
CCP2MX	CONFIG3H	CCP2 MUX bit
		<ul> <li>1 = CCP2 input/output is multiplexed with RC1</li> <li>0 = CCP2 input/output is multiplexed with RB3</li> </ul>
DEBUG	CONFIG4L	Background Debugger Enable bit
DEBUG	CONFIG4L	1 = Background debugger disabled, RB6 and RB7 configured as general
		purpose I/O pins
		0 = Background debugger enabled, RB6 and RB7 are dedicated to In-Circuit
		Debug
XINST	CONFIG4L	Extended Instruction Set Enable bit
		1 = Instruction set extension and Indexed Addressing mode enabled
		0 = Instruction set extension and Indexed Addressing mode disabled
		(Legacy mode)
LVP	CONFIG4L	Low-Voltage Programming Enable bit
		1 = Low-Voltage Programming enabled, RB5 is the PGM pin
		0 = Low-Voltage Programming disabled, RB5 is an I/O pin
STVREN	CONFIG4L	Stack Overflow/Underflow Reset Enable bit
		<ul> <li>1 = Reset on stack overflow/underflow enabled</li> <li>0 = Reset on stack overflow/underflow disabled</li> </ul>

#### TABLE 5-3: PIC18F2XK20/4XK20 BIT DESCRIPTIONS (CONTINUED)

## 5.3 Single-Supply ICSP Programming

The LVP bit in Configuration register, CONFIG4L, enables Single-Supply (Low-Voltage) ICSP Programming. The LVP bit defaults to a '1' (enabled) from the factory.

If Single-Supply Programming mode is not used, the LVP bit can be programmed to a '0' and RB5/PGM becomes a digital I/O pin. However, the LVP bit may only be programmed by entering the High-Voltage ICSP mode, where MCLR/VPP/RE3 is raised to VIHH. Once the LVP bit is programmed to a '0', only the High-Voltage ICSP mode is available and only the High-Voltage ICSP mode can be used to program the device.

- Note 1: The High-Voltage ICSP mode is always available, regardless of the state of the LVP bit, by applying VIHH to the MCLR/ VPP/RE3 pin.
  - 2: While in Low-Voltage ICSP mode, the RB5 pin can no longer be used as a general purpose I/O.

#### 5.4 Embedding Configuration Word Information in the HEX File

To allow portability of code, a PIC18F2XK20/4XK20 programmer is required to read the Configuration Word locations from the hex file. If Configuration Word information is not present in the hex file, then a simple warning message should be issued. Similarly, while saving a hex file, all Configuration Word information must be included. An option to not include the Configuration Word information may be provided. When embedding Configuration Word information in the hex file, it should start at address 300000h.

Microchip Technology Inc. feels strongly that this feature is important for the benefit of the end customer.

#### 5.5 Embedding Data EEPROM Information In the HEX File

To allow portability of code, a PIC18F2XK20/4XK20 programmer is required to read the data EEPROM information from the hex file. If data EEPROM information is not present, a simple warning message should be issued. Similarly, when saving a hex file, all data EEPROM information must be included. An option to not include the data EEPROM information may be provided. When embedding data EEPROM information in the hex file, it should start at address F00000h.

Microchip Technology Inc. believes that this feature is important for the benefit of the end customer.

## 5.6 Checksum Computation

The checksum is calculated by summing the following:

- The contents of all code memory locations
- The Configuration Word, appropriately masked
- ID locations (Only if any portion of program memory is code-protected)

The Least Significant 16 bits of this sum are the checksum.

Code protection limits access to program memory by both external programmer (code-protect) and code execution (table read protect). The ID locations, when included in a code protected checksum, contain the checksum of an unprotected part. The unprotected checksum is distributed: one nibble per ID location. Each nibble is right justified.

Table 5-4 describes how to calculate the checksum for each device.

**Note:** The checksum calculation differs depending on the code-protect setting. Since the code memory locations read out differently depending on the code-protect setting, the table describes how to manipulate the actual code memory values to simulate the values that would be read from a protected device. When calculating a checksum by reading a device, the entire code memory can simply be read and summed. The Configuration Word and ID locations can always be read.

Device	Code- Protect	Checksum	Blank Value	0xAA at 0 and Max Address
PIC18FX3K20	None	SUM[0000:01FF]+SUM[0200:0FFF]+SUM[1000:1FFF]+ (CONFIG1L & 00h)+(CONFIG1H & CFh)+(CONFIG2L & 1Fh)+ (CONFIG2H & 1F)+(CONFIG3L & 00h)+(CONFIG3H & 8Fh)+ (CONFIG4L & C5h)+(CONFIG4H & 00h)+(CONFIG5L & 03h)+ (CONFIG5H & C0h)+(CONFIG6L & 03h)+(CONFIG6H & E0h)+ (CONFIG7L & 03h)+(CONFIG7H & 40h)	E33Eh	E294h

#### Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Microchip received ISO/TS-16949:2002 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
