
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	16-Bit
Speed	32MHz
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, HLVD, POR, PWM, WDT
Number of I/O	38
Program Memory Size	16KB (5.5K x 24)
Program Memory Type	FLASH
EEPROM Size	512 x 8
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 5.5V
Data Converters	A/D 16x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	48-UFQFN Exposed Pad
Supplier Device Package	48-UQFN (6x6)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic24fv16ka304-i-mv

7.1 Clock Source Selection at Reset

If clock switching is enabled, the system clock source at device Reset is chosen, as shown in Table 7-2. If clock switching is disabled, the system clock source is always selected according to the Oscillator Configuration bits. For more information, see **Section 9.0 "Oscillator Configuration"**.

TABLE 7-2: OSCILLATOR SELECTION vs. TYPE OF RESET (CLOCK SWITCHING ENABLED)

Reset Type	Clock Source Determinant
POR	FNOSCx Configuration bits (FNOSC<10:8>)
BOR	
$\overline{MCLR}$	COSCx Control bits (OSCCON<14:12>)
WDTO	
SWR	

7.2 Device Reset Times

The Reset times for various types of device Reset are summarized in Table 7-3. Note that the System Reset Signal, $\overline{SYSRST}$, is released after the POR and PWRT delay times expire.

The time at which the device actually begins to execute code will also depend on the system oscillator delays, which include the Oscillator Start-up Timer (OST) and the PLL lock time. The OST and PLL lock times occur in parallel with the applicable $\overline{SYSRST}$ delay times.

The FSCM delay determines the time at which the FSCM begins to monitor the system clock source after the $\overline{SYSRST}$ signal is released.

TABLE 7-3: DELAY TIMES FOR VARIOUS DEVICE RESETS

Reset Type	Clock Source	$\overline{SYSRST}$ Delay	System Clock Delay	Notes
POR(6)	EC	TPOR + TPWRT	—	1, 2
	FRC, FRCDIV	TPOR + TPWRT	TFRC	1, 2, 3
	LPRC	TPOR + TPWRT	TLPRC	1, 2, 3
	ECPLL	TPOR + TPWRT	TLOCK	1, 2, 4
	FRCPLL	TPOR + TPWRT	TFRC + TLOCK	1, 2, 3, 4
	XT, HS, SOSC	TPOR+ TPWRT	TOST	1, 2, 5
	XTPLL, HSPLL	TPOR + TPWRT	TOST + TLOCK	1, 2, 4, 5
BOR	EC	TPWRT	—	2
	FRC, FRCDIV	TPWRT	TFRC	2, 3
	LPRC	TPWRT	TLPRC	2, 3
	ECPLL	TPWRT	TLOCK	2, 4
	FRCPLL	TPWRT	TFRC + TLOCK	2, 3, 4
	XT, HS, SOSC	TPWRT	TOST	2, 5
	XTPLL, HSPLL	TPWRT	TFRC + TLOCK	2, 3, 4
All Others	Any Clock	—	—	None

Note 1: TPOR = Power-on Reset delay.

2: TPWRT = 64 ms nominal if the Power-up Timer (PWRT) is enabled; otherwise, it is zero.

3: TFRC and TLPRC = RC oscillator start-up times.

4: TLOCK = PLL lock time.

5: TOST = Oscillator Start-up Timer (OST). A 10-bit counter waits 1024 oscillator periods before releasing the oscillator clock to the system.

6: If Two-Speed Start-up is enabled, regardless of the primary oscillator selected, the device starts with FRC, and in such cases, FRC start-up time is valid.

Note: For detailed operating frequency and timing specifications, see **Section 29.0 "Electrical Characteristics"**.

9.0 OSCILLATOR CONFIGURATION

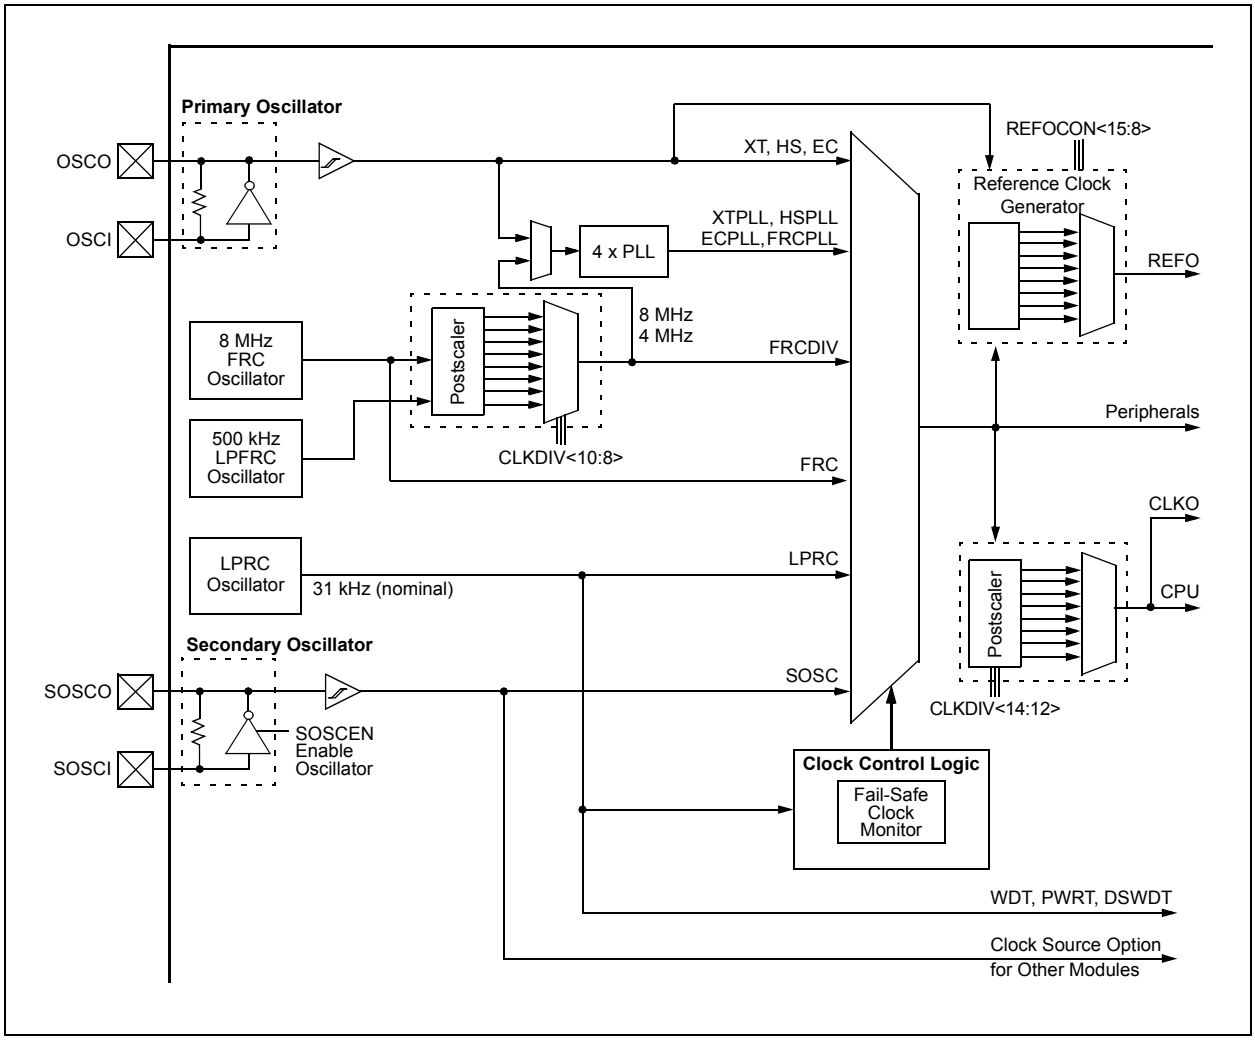
Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on Oscillator Configuration, refer to the *"PIC24F Family Reference Manual"*, **Section 38. "Oscillator with 500 kHz Low-Power FRC"** (DS39726).

The oscillator system for the PIC24FV32KA304 family of devices has the following features:

- A total of five external and internal oscillator options as clock sources, providing 11 different clock modes.
- On-chip 4x Phase Locked Loop (PLL) to boost internal operating frequency on select internal and external oscillator sources.
- Software-controllable switching between various clock sources.
- Software-controllable postscaler for selective clocking of CPU for system power savings.
- System frequency range declaration bits for EC mode. When using an external clock source, the current consumption is reduced by setting the declaration bits to the expected frequency range.
- A Fail-Safe Clock Monitor (FSCM) that detects clock failure and permits safe application recovery or shutdown.

A simplified diagram of the oscillator system is shown in Figure 9-1.

FIGURE 9-1: PIC24FV32KA304 FAMILY CLOCK DIAGRAM



15.0 OUTPUT COMPARE WITH DEDICATED TIMERS

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"PIC24F Family Reference Manual"*, **Section 35. "Output Compare with Dedicated Timer"** (DS39723).

All devices in the PIC24FV32KA304 family feature 3 independent output compare modules. Each of these modules offers a wide range of configuration and operating options for generating pulse trains on internal device events. Also, the modules can produce Pulse-Width Modulated (PWM) waveforms for driving power applications.

Key features of the output compare module include:

- Hardware-configurable for 32-bit operation in all modes by cascading two adjacent modules
- Synchronous and Trigger modes of output compare operation, with up to 21 user-selectable Sync/trigger sources available
- Two separate Period registers (a main register, OCxR, and a secondary register, OCxRS) for greater flexibility in generating pulses of varying widths
- Configurable for single pulse or continuous pulse generation on an output event, or continuous PWM waveform generation
- Up to 6 clock sources available for each module, driving a separate internal 16-bit counter

15.1 General Operating Modes

15.1.1 SYNCHRONOUS AND TRIGGER MODES

By default, the output compare module operates in a Free-Running mode. The internal 16-bit counter, OCxTMR, counts up continuously, wrapping around from FFFFh to 0000h on each overflow, with its period synchronized to the selected external clock source. Compare or PWM events are generated each time a match between the internal counter and one of the Period registers occurs.

In Synchronous mode, the module begins performing its compare or PWM operation as soon as its selected clock source is enabled. Whenever an event occurs on the selected Sync source, the module's internal counter is reset. In Trigger mode, the module waits for a Sync event from another internal module to occur before allowing the counter to run.

Free-Running mode is selected by default or any time that the SYNCSELx bits (OCxCON2<4:0>) are set to '00000'. Synchronous or Trigger modes are selected any time the SYNCSELx bits are set to any value except '00000'. The OCTRIG bit (OCxCON2<7>) selects either Synchronous or Trigger mode. Setting this bit selects Trigger mode operation. In both modes, the SYNCSELx bits determine the Sync/trigger source.

15.1.2 CASCADED (32-BIT) MODE

By default, each module operates independently with its own set of 16-bit Timer and Duty Cycle registers. To increase the range, adjacent even and odd numbered modules can be configured to function as a single 32-bit module. (For example, Modules 1 and 2 are paired, as are Modules 3 and 4, and so on.) The odd numbered module (OCx) provides the Least Significant 16 bits of the 32-bit register pairs, and the even numbered module (OCy) provides the Most Significant 16 bits. Wraparounds of the OCx registers cause an increment of their corresponding OCy registers.

Cascaded operation is configured in hardware by setting the OC32 bit (OCxCON2<8>) for both modules.

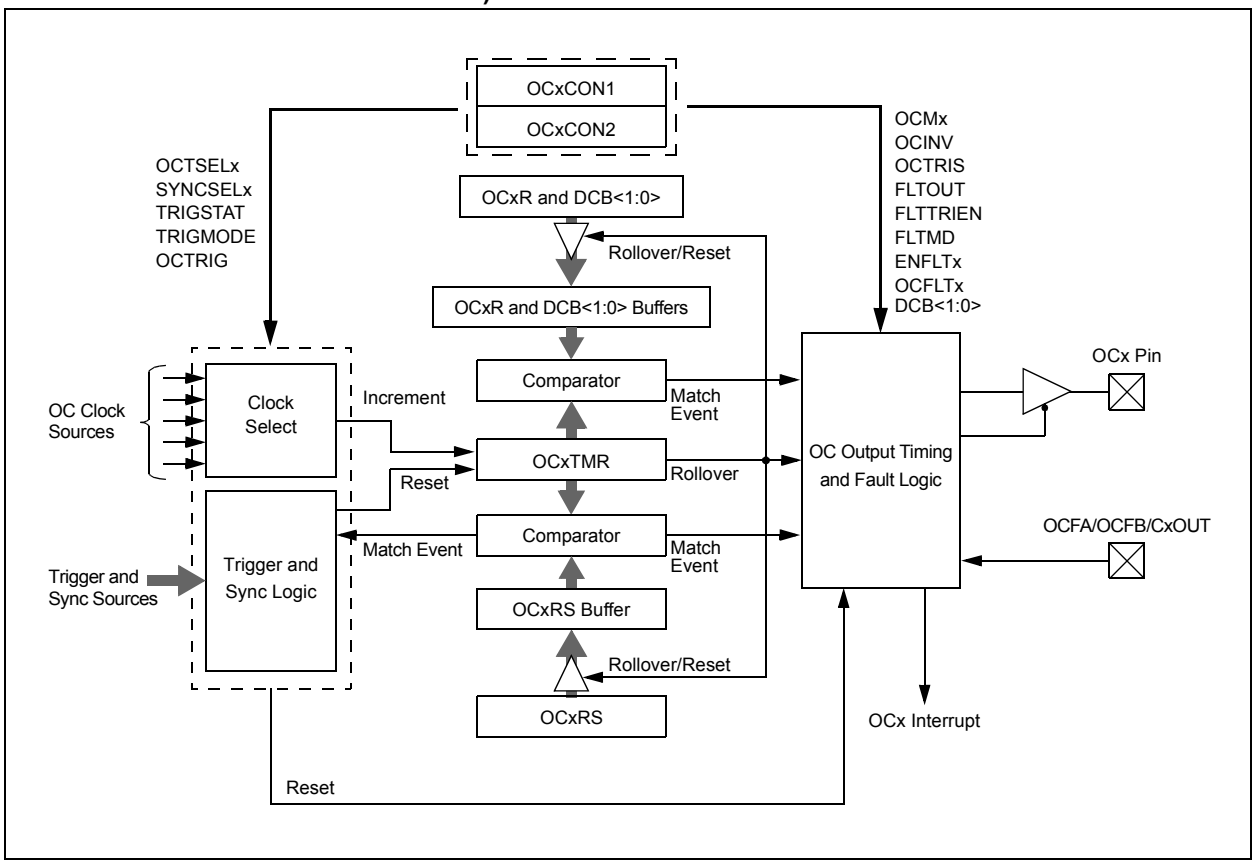
15.3 Pulse-Width Modulation (PWM) Mode

In PWM mode, the output compare module can be configured for edge-aligned or center-aligned pulse waveform generation. All PWM operations are double-buffered (buffer registers are internal to the module and are not mapped into SFR space).

To configure the output compare module for edge-aligned PWM operation:

1. Calculate the desired ON time and load it into the OCxR register.
2. Calculate the desired period and load it into the OCxRS register.
3. Select the current OCx as the synchronization source by writing 0x1F to SYNCSEL<4:0> (OCxCON2<4:0>) and '0' to OCTRIG (OCxCON2<7>).
4. Select a clock source by writing the OCTSEL2<2:0> (OCxCON<12:10>) bits.
5. Enable interrupts, if required, for the timer and output compare modules. The output compare interrupt is required for PWM Fault pin utilization.
6. Select the desired PWM mode in the OCM<2:0> (OCxCON1<2:0>) bits.
7. If a timer is selected as a clock source, set the TMRy prescale value and enable the time base by setting the TON (TxCON<15>) bit.

FIGURE 15-2: OUTPUT COMPARE x BLOCK DIAGRAM (DOUBLE-BUFFERED, 16-BIT PWM MODE)



15.4 Subcycle Resolution

The DCBx bits (OCxCON2<10:9>) provide for resolution better than one instruction cycle. When used, they delay the falling edge generated from a match event by a portion of an instruction cycle.

For example, setting DCB<1:0> = 10 causes the falling edge to occur halfway through the instruction cycle in which the match event occurs, instead of at the beginning. These bits cannot be used when OCM<2:0> = 001. When operating the module in PWM mode (OCM<2:0> = 110 or 111), the DCBx bits will be double-buffered.

The DCBx bits are intended for use with a clock source identical to the system clock. When an OCx module with enabled prescaler is used, the falling edge delay caused by the DCBx bits will be referenced to the system clock period, rather than the OCx module's period.

TABLE 15-1: EXAMPLE PWM FREQUENCIES AND RESOLUTIONS AT 4 MIPS (FCY = 4 MHz)(1)

PWM Frequency	7.6 Hz	61 Hz	122 Hz	977 Hz	3.9 kHz	31.3 kHz	125 kHz
Prescaler Ratio	8	1	1	1	1	1	1
Period Value	FFFFh	FFFFh	7FFFh	0FFFh	03FFh	007Fh	001Fh
Resolution (bits)	16	16	15	12	10	7	5

Note 1: Based on FCY = FOSC/2; Doze mode and PLL are disabled.

TABLE 15-2: EXAMPLE PWM FREQUENCIES AND RESOLUTIONS AT 16 MIPS (FCY = 16 MHz)(1)

PWM Frequency	30.5 Hz	244 Hz	488 Hz	3.9 kHz	15.6 kHz	125 kHz	500 kHz
Prescaler Ratio	8	1	1	1	1	1	1
Period Value	FFFFh	FFFFh	7FFFh	0FFFh	03FFh	007Fh	001Fh
Resolution (bits)	16	16	15	12	10	7	5

Note 1: Based on FCY = FOSC/2; Doze mode and PLL are disabled.

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **ALRMEN:** Alarm Enable bit

1 = Alarm is enabled (cleared automatically after an alarm event whenever ARPT<7:0> = 00h and CHIME = 0)

0 = Alarm is disabled

bit 14 **CHIME:** Chime Enable bit

1 = Chime is enabled; ARPT<7:0> bits are allowed to roll over from 00h to FFh

0 = Chime is disabled; ARPT<7:0> bits stop once they reach 00h

bit 13-10 **AMASK<3:0>:** Alarm Mask Configuration bits

0000 = Every half second
0001 = Every second
0010 = Every 10 seconds
0011 = Every minute
0100 = Every 10 minutes
0101 = Every hour
0110 = Once a day
0111 = Once a week
1000 = Once a month
1001 = Once a year (except when configured for February 29th, once every 4 years)
101x = Reserved – do not use
11xx = Reserved – do not use

bit 9-8 **ALRMPTR<1:0>:** Alarm Value Register Window Pointer bits

Points to the corresponding Alarm Value registers when reading the ALRMVALH and ALRMVALL registers. The ALRMPTR<1:0> value decrements on every read or write of ALRMVALH until it reaches '00'.

ALRMVAL<15:8>:
00 = ALRMMIN
01 = ALRMWD
10 = ALRMMNTH
11 = Unimplemented

ALRMVAL<7:0>:
00 = ALRMSEC
01 = ALRMHR
10 = ALRMDAY
11 = Unimplemented

bit 7-0 **ARPT<7:0>:** Alarm Repeat Counter Value bits

11111111 = Alarm will repeat 255 more times
.
.
.
00000000 = Alarm will not repeat

The counter decrements on any alarm event; it is prevented from rolling over from 00h to FFh unless CHIME = 1.

REGISTER 19-11: RTCCSWT: CONTROL/SAMPLE WINDOW TIMER REGISTER(1)

bit 15-8 **PWCSTAB<7:0>:** PWM Stability Window Timer bits

11111111 = Stability window is 255 TPWCCLK clock periods

.

.

.

00000000 = Stability window is 0 TPWCCLK clock periods

The sample window starts when the alarm event triggers. The stability window timer starts counting from every alarm event when PWCEN = 1.

bit 7-0 **PWCSAMP<7:0>:** PWM Sample Window Timer bits

11111111 = Sample window is always enabled, even when PWCEN = 0

11111110 = Sample window is 254 TPWCCLK clock periods

.

.

.

00000000 = Sample window is 0 TPWCCLK clock periods

The sample window timer starts counting at the end of the stability window when PWCEN = 1. If PWCSTAB<7:0> = 00000000, the sample window timer starts counting from every alarm event when PWCEN = 1.

Note 1: A write to this register is only allowed when RTCWREN = 1.

bit 15 **ASEN:** Auto-Scan Enable bit(1)
- 1 = Auto-scan is enabled
- 0 = Auto-scan is disabled

bit 14 **LPEN:** Low-Power Enable bit
- 1 = Returns to Low-Power mode after scan
- 0 = Remains in Full-Power mode after scan

bit 13 **CTMREQ:** CTMU Request bit
- 1 = CTMU is enabled when the A/D is enabled and active
- 0 = CTMU is not enabled by the A/D

bit 12 **BGREQ:** Band Gap Request bit
- 1 = Band gap is enabled when the A/D is enabled and active
- 0 = Band gap is not enabled by the A/D

bit 11 **Reserved:** Maintain as '0'

bit 10 **Unimplemented:** Read as '0'

bit 9-8 **ASINT<1:0>:** Auto-Scan (Threshold Detect) Interrupt Mode bits
- 11 = Interrupt after a Threshold Detect sequence completed and a valid compare has occurred
- 10 = Interrupt after a valid compare has occurred
- 01 = Interrupt after a Threshold Detect sequence completed
- 00 = No interrupt

bit 7-4 **Unimplemented:** Read as '0'

bit 3-2 **WM<1:0>:** Write Mode bits
- 11 = Reserved
- 10 = Auto-compare only (conversion results are not saved, but interrupts are generated when a valid match, as defined by the CMx and ASINTx bits, occurs)
- 01 = Convert and save (conversion results are saved to locations as determined by the register bits when a match, as defined by the CMx bits, occurs)
- 00 = Legacy operation (conversion data is saved to a location determined by the buffer register bits)

bit 1-0 **CM<1:0>:** Compare Mode bits
- 11 = Outside Window mode (valid match occurs if the conversion result is outside of the window defined by the corresponding buffer pair)
- 10 = Inside Window mode (valid match occurs if the conversion result is inside the window defined by the corresponding buffer pair)
- 01 = Greater Than mode (valid match occurs if the result is greater than the value in the corresponding buffer register)
- 00 = Less Than mode (valid match occurs if the result is less than the value in the corresponding buffer register)

Note 1: When using auto-scan with Threshold Detect (ASEN = 1), do not configure the sample clock source to Auto-Convert mode (SSRCx = 7). Any other available SSRCx selection is valid. To use auto-convert as the sample clock source (SSRCx = 7), make sure ASEN is cleared.

22.3 Transfer Function

The transfer functions of the A/D Converter in 12-bit resolution are shown in Figure 22-3. The difference of the input voltages, (V_{INH} – V_{INL}), is compared to the reference, ((V_{R+}) – (V_{R-})).

- The first code transition occurs when the input voltage is ((V_{R+}) – (V_{R-}))/4096 or 1.0 LSb.
- The `0000 0000 0001` code is centered at V_{R-} + (1.5 * ((V_{R+}) – (V_{R-}))/4096).
- The '`0010 0000 0000`' code is centered at V_{REFL} + (2048.5 * ((V_{R+}) – (V_{R-}))/4096).
- An input voltage less than V_{R-} + (((V_{R-}) – (V_{R-}))/4096) converts as '`0000 0000 0000`'.
- An input voltage greater than (V_{R-}) + (4095 ((V_{R+}) – (V_{R-}))/4096) converts as '`1111 1111 1111`'.

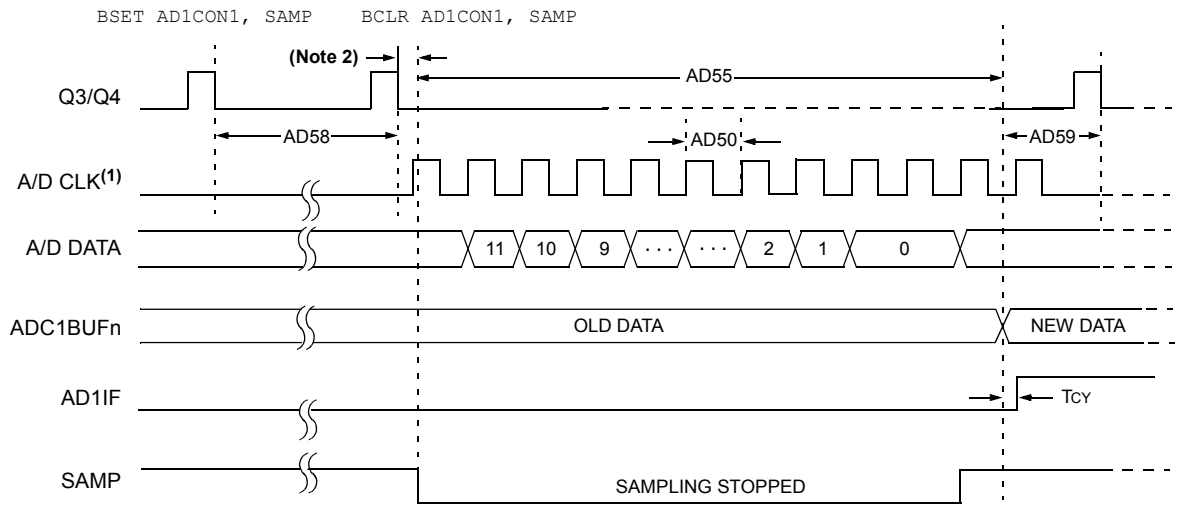
SP41	TscH2diL, TscL2diL	Hold Time of SDIx Data Input to SCKx Edge	20	—	—	ns	
SP50	TssL2scH, TssL2scL	$\overline{SSx}$ ↓ to SCKx ↓ or SCKx ↑ Input	120	—	—	ns	
SP51	TssH2doZ	$\overline{SSx}$ ↑ to SDOx Output High-Impedance(3)	10	—	50	ns	
SP52	TscH2ssH TscL2ssH	$\overline{SSx}$ ↑ after SCKx Edge	1.5 TCY + 40	—	—	ns	
SP60	TssL2doV	SDOx Data Output Valid after $\overline{SSx}$ Edge	—	—	50	ns	

Note 1: Data in "Typ" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: The minimum clock period for SCKx is 100 ns; therefore, the clock generated in Master mode must not violate this specification.

3: This assumes a 50 pF load on all SPIx pins.

FIGURE 29-22: A/D CONVERSION TIMING



Note 1: If the A/D clock source is selected as RC, a time of TCY is added before the A/D clock starts. This allows the SLEEP instruction to be executed.

2: This is a minimal RC delay (typically 100 ns) which also disconnects the holding capacitor from the analog input.

TABLE 29-41: A/D CONVERSION TIMING REQUIREMENTS(1)

AC CHARACTERISTICS			Standard Operating Conditions: 1.8V to 3.6V PIC24F32KA3XX 2.0V to 5.5V PIC24FV32KA3XX Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param No.	**Symbol**	**Characteristic**	**Min.**	**Typ**	**Max.**	**Units**	**Conditions**
Clock Parameters							
AD50	TAD	A/D Clock Period	600	—	—	ns	TCY = 75 ns, AD1CON3 in default state
AD51	TRC	A/D Internal RC Oscillator Period	—	1.67	—	µs	
Conversion Rate							
AD55	TCONV	Conversion Time	— —	12 14	— —	TAD TAD	10-bit results 12-bit results
AD56	FCNV	Throughput Rate	—	—	100	ksps	
AD57	TSAMP	Sample Time	—	1	—	TAD	
AD58	TACQ	Acquisition Time	750	—	—	ns	**(Note 2)**
AD59	TSWC	Switching Time from Convert to Sample	—	—	**(Note 3)**		
AD60	TDIS	Discharge Time	12	—	—	TAD	
Clock Parameters							
AD61	TPSS	Sample Start Delay from Setting Sample bit (SAMP)	2	—	3	TAD	

Note 1: Because the sample caps will eventually lose charge, clock rates below 10 kHz can affect linearity performance, especially at elevated temperatures.

2: The time for the holding capacitor to acquire the “New” input voltage when the voltage changes full scale after the conversion (VDD to VSS or VSS to VDD).

3: On the following cycle of the device clock.

Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Number of Pins	N		20	
Pitch	e		0.65 BSC	
Overall Height	A	–	–	2.00
Molded Package Thickness	A2	1.65	1.75	1.85
Standoff	A1	0.05	–	–
Overall Width	E	7.40	7.80	8.20
Molded Package Width	E1	5.00	5.30	5.60
Overall Length	D	6.90	7.20	7.50
Foot Length	L	0.55	0.75	0.95
Footprint	L1		1.25 REF	
Lead Thickness	c	0.09	–	0.25
Foot Angle	ϕ	0°	4°	8°
Lead Width	b	0.22	–	0.38

Notes:

1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.20 mm per side.
3. Dimensioning and tolerancing per ASME Y14.5M.

BSC: Basic Dimension. Theoretically exact value shown without tolerances.
REF: Reference Dimension, usually without tolerance, for information purposes only.
