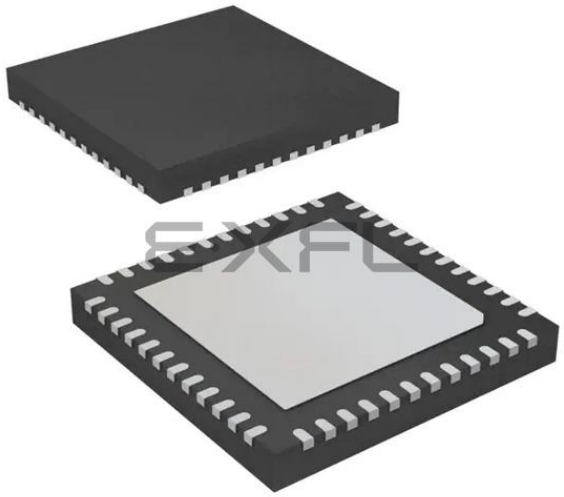
Microchip Technology - PIC24FV32KA304-E/MV Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	PIC
Core Size	16-Bit
Speed	32MHz
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, HLVD, POR, PWM, WDT
Number of I/O	38
Program Memory Size	32KB (11K x 24)
Program Memory Type	FLASH
EEPROM Size	512 x 8
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 5.5V
Data Converters	A/D 16x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	48-UFQFN Exposed Pad
Supplier Device Package	48-UQFN (6x6)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic24fv32ka304-e-mv

6.0 DATA EEPROM MEMORY

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on Data EEPROM, refer to the *"PIC24F Family Reference Manual"*, **Section 5. "Data EEPROM"** (DS39720).

The data EEPROM memory is a Nonvolatile Memory (NVM), separate from the program and volatile data RAM. Data EEPROM memory is based on the same Flash technology as program memory, and is optimized for both long retention and a higher number of erase/write cycles.

The data EEPROM is mapped to the top of the user program memory space, with the top address at program memory address, 7FFE00h to 7FFFFFh. The size of the data EEPROM is 256 words in the PIC24FV32KA304 family devices.

The data EEPROM is organized as 16-bit wide memory. Each word is directly addressable, and is readable and writable during normal operation over the entire VDD range.

Unlike the Flash program memory, normal program execution is not stopped during a data EEPROM program or erase operation.

The data EEPROM programming operations are controlled using the three NVM Control registers:

- NVMCON: Nonvolatile Memory Control Register
- NVMKEY: Nonvolatile Memory Key Register
- NVMADR: Nonvolatile Memory Address Register

6.1 NVMCON Register

The NVMCON register (Register 6-1) is also the primary control register for data EEPROM program/erase operations. The upper byte contains the control bits used to start the program or erase cycle, and the flag bit to indicate if the operation was successfully performed. The lower byte of NVMCOM configures the type of NVM operation that will be performed.

6.2 NVMKEY Register

The NVMKEY is a write-only register that is used to prevent accidental writes or erasures of data EEPROM locations.

To start any programming or erase sequence, the following instructions must be executed first, in the exact order provided:

1. Write 55h to NVMKEY.
2. Write AAh to NVMKEY.

After this sequence, a write will be allowed to the NVMCON register for one instruction cycle. In most cases, the user will simply need to set the WR bit in the NVMCON register to start the program or erase cycle. Interrupts should be disabled during the unlock sequence.

The MPLAB® C30 C compiler provides a defined library procedure (`builtin_write_NVM`) to perform the unlock sequence. Example 6-1 illustrates how the unlock sequence can be performed with in-line assembly.

EXAMPLE 6-1: DATA EEPROM UNLOCK SEQUENCE

```
//Disable Interrupts For 5 instructions
asm volatile   ("disi #5");
//Issue Unlock Sequence
asm volatile   ("mov #0x55, W0     \n"
                "mov W0, NVMKEY    \n"
                "mov #0xAA, W1     \n"
                "mov W1, NVMKEY    \n");
// Perform Write/Erase operations
asm volatile   ("bset NVMCON, #WR  \n"
                "nop               \n"
                "nop               \n");
```

6.4.1 ERASE DATA EEPROM

The data EEPROM can be fully erased, or can be partially erased, at three different sizes: one word, four words or eight words. The bits, NVMOP<1:0> (NVMCON<1:0>), decide the number of words to be erased. To erase partially from the data EEPROM, the following sequence must be followed:

1. Configure NVMCON to erase the required number of words: one, four or eight.
2. Load TBLPAG and WREG with the EEPROM address to be erased.
3. Clear the NVMIF status bit and enable the NVM interrupt (optional).
4. Write the key sequence to NVMKEY.
5. Set the WR bit to begin the erase cycle.
6. Either poll the WR bit or wait for the NVM interrupt (NVMIF is set).

A typical erase sequence is provided in Example 6-2. This example shows how to do a one-word erase. Similarly, a four-word erase and an eight-word erase can be done. This example uses C library procedures to manage the Table Pointer (`builtin_tblpage` and `builtin_tbloffset`) and the Erase Page Pointer (`builtin_tblwtl`). The memory unlock sequence (`builtin_write_NVM`) also sets the WR bit to initiate the operation and returns control when complete.

EXAMPLE 6-2: SINGLE-WORD ERASE

```
int __attribute__ ((space(eedata))) eeData = 0x1234;
/*-----------------------------------------------------------------------------------------------
The variable eeData must be a Global variable declared outside of any method

the code following this comment can be written inside the method that will execute the erase
-----------------------------------------------------------------------------------------------
*/
    unsigned int offset;

    // Set up NVMCON to erase one word of data EEPROM
    NVMCON = 0x4058;

    // Set up a pointer to the EEPROM location to be erased
    TBLPAG = __builtin_tblpage(&eeData);            // Initialize EE Data page pointer
    offset = __builtin_tbloffset(&eeData);          // Initizlize lower word of address
    __builtin_tblwtl(offset, 0);                    // Write EEPROM data to write latch

    asm volatile ("disi #5");                       // Disable Interrupts For 5 Instructions
    __builtin_write_NVM();                          // Issue Unlock Sequence & Start Write Cycle
    while(NVMCONbits.WR=1);                         // Optional: Poll WR bit to wait for
                                                    // write sequence to complete
```

6.4.3 READING THE DATA EEPROM

To read a word from data EEPROM, the table read instruction is used. Since the EEPROM array is only 16 bits wide, only the TBLRDL instruction is needed. The read operation is performed by loading TBLPAG and WREG with the address of the EEPROM location, followed by a TBLRDL instruction.

A typical read sequence, using the Table Pointer management (builtin_tblpage and builtin_tbloffset) and table read procedures (builtin_tblrdl) from the C30 compiler library, is provided in Example 6-5.

Program Space Visibility (PSV) can also be used to read locations in the data EEPROM.

EXAMPLE 6-5: READING THE DATA EEPROM USING THE TBLRD COMMAND

```
int __attribute__ ((space(eedata))) eeData = 0x1234;
int data;                                          // Data read from EEPROM
/*-----------------------------------------------------------------------------------------------
The variable eeData must be a Global variable declared outside of any method

the code following this comment can be written inside the method that will execute the read
-----------------------------------------------------------------------------------------------
*/
    unsigned int offset;

    // Set up a pointer to the EEPROM location to be erased
    TBLPAG = __builtin_tblpage(&eeData);               // Initialize EE Data page pointer
    offset = __builtin_tbloffset(&eeData);             // Initizlize lower word of address
    data = __builtin_tblrdl(offset);                   // Write EEPROM data to write latch
```

7.0 RESETS

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on Resets, refer to the *"PIC24F Family Reference Manual"*, **Section 40. "Reset with Programmable Brown-out Reset"** (DS39728).

The Reset module combines all Reset sources and controls the device Master Reset Signal, $\overline{SYSRST}$. The following is a list of device Reset sources:

- POR: Power-on Reset
- $\overline{MCLR}$: Pin Reset
- SWR: RESET Instruction
- WDTR: Watchdog Timer Reset
- BOR: Brown-out Reset
- Low-Power BOR/Deep Sleep BOR
- TRAPR: Trap Conflict Reset
- IOPUWR: Illegal Opcode Reset
- UWR: Uninitialized W Register Reset

A simplified block diagram of the Reset module is shown in Figure 7-1.

Any active source of Reset will make the $\overline{SYSRST}$ signal active. Many registers associated with the CPU and peripherals are forced to a known Reset state. Most registers are unaffected by a Reset; their status is unknown on Power-on Reset (POR) and unchanged by all other Resets.

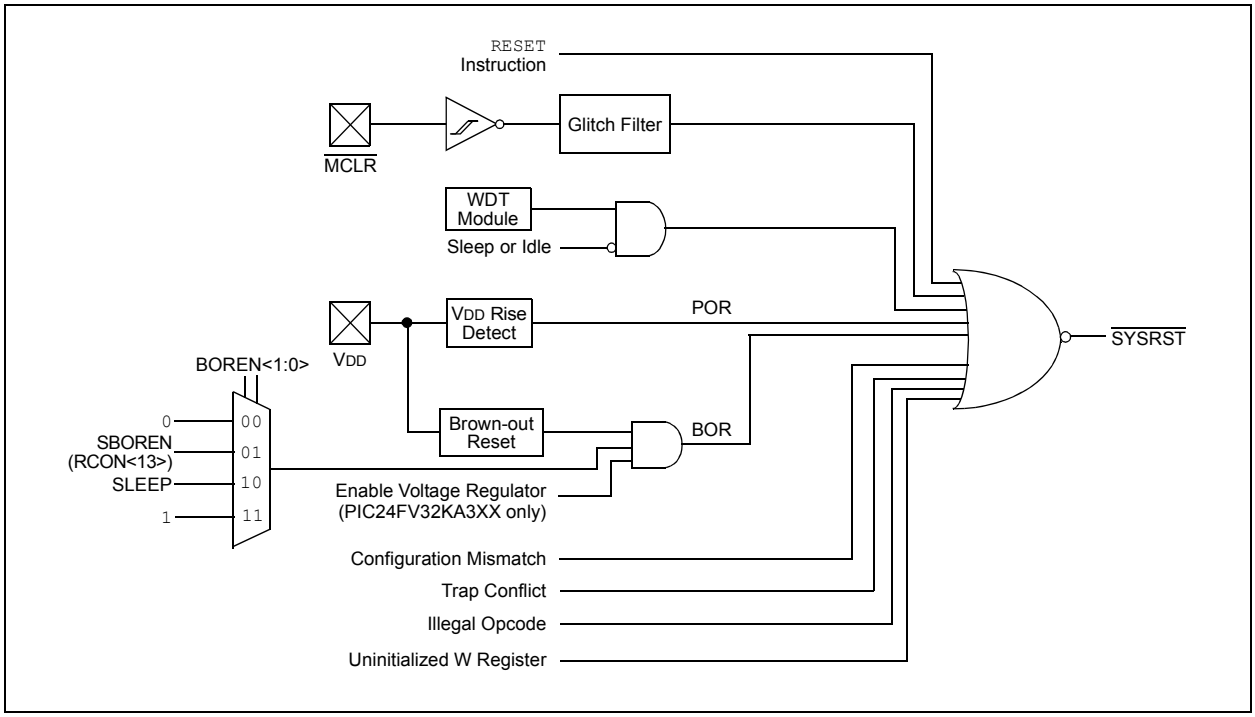
Note: Refer to the specific peripheral or **Section 3.0 "CPU"** of this data sheet for register Reset states.

All types of device Reset will set a corresponding status bit in the RCON register to indicate the type of Reset (see Register 7-1). A Power-on Reset will clear all bits except for the BOR and POR bits (RCON<1:0>) which are set. The user may set or clear any bit at any time during code execution. The RCON bits only serve as status bits. Setting a particular Reset status bit in software will not cause a device Reset to occur.

The RCON register also has other bits associated with the Watchdog Timer (WDT) and device power-saving states. The function of these bits is discussed in other sections of this manual.

Note: The status bits in the RCON register should be cleared after they are read so that the next RCON register value after a device Reset will be meaningful.

FIGURE 7-1: RESET SYSTEM BLOCK DIAGRAM



8.0 INTERRUPT CONTROLLER

Note:	This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Interrupt Controller, refer to the *"PIC24F Family Reference Manual"*, **Section 8. "Interrupts"** (DS39707).

The PIC24F interrupt controller reduces the numerous peripheral interrupt request signals to a single interrupt request signal to the CPU. It has the following features:

- Up to Eight Processor Exceptions and Software Traps
- Seven User-Selectable Priority Levels
- Interrupt Vector Table (IVT) with up to 118 Vectors
- Unique Vector for each Interrupt or Exception Source
- Fixed Priority within a Specified User Priority Level
- Alternate Interrupt Vector Table (AIVT) for Debug Support
- Fixed Interrupt Entry and Return Latencies

8.1 Interrupt Vector Table (IVT)

The IVT is shown in Figure 8-1. The IVT resides in the program memory, starting at location, 000004h. The IVT contains 126 vectors, consisting of eight non-maskable trap vectors, plus up to 118 sources of interrupt. In general, each interrupt source has its own vector. Each interrupt vector contains a 24-bit wide address. The value programmed into each interrupt vector location is the starting address of the associated Interrupt Service Routine (ISR).

Interrupt vectors are prioritized in terms of their natural priority; this is linked to their position in the vector table. All other things being equal, lower addresses have a higher natural priority. For example, the interrupt associated with Vector 0 will take priority over interrupts at any other vector address.

PIC24FV32KA304 family devices implement non-maskable traps and unique interrupts; these are summarized in Table 8-1 and Table 8-2.

8.1.1 ALTERNATE INTERRUPT VECTOR TABLE (AIVT)

The Alternate Interrupt Vector Table (AIVT) is located after the IVT, as shown in Figure 8-1. Access to the AIVT is provided by the ALTIVT control bit (INTCON2<15>). If the ALTIVT bit is set, all interrupt and exception processes will use the alternate vectors instead of the default vectors. The alternate vectors are organized in the same manner as the default vectors.

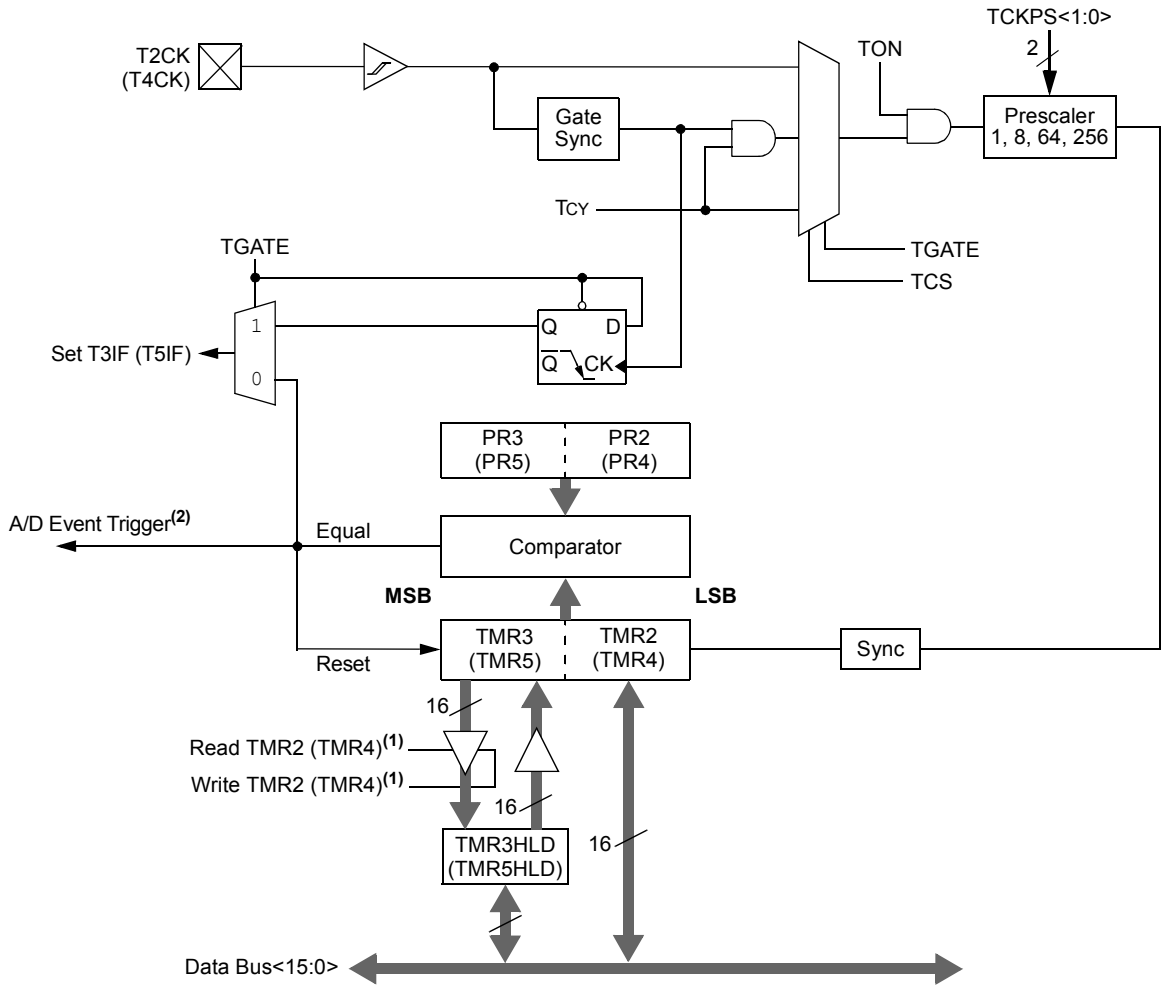
The AIVT supports emulation and debugging efforts by providing a means to switch between an application and a support environment without requiring the interrupt vectors to be reprogrammed. This feature also enables switching between applications for evaluation of different software algorithms at run time. If the AIVT is not needed, the AIVT should be programmed with the same addresses used in the IVT.

8.2 Reset Sequence

A device Reset is not a true exception, because the interrupt controller is not involved in the Reset process. The PIC24F devices clear their registers in response to a Reset, which forces the Program Counter (PC) to zero. The microcontroller then begins program execution at location, 000000h. The user programs a `GOTO` instruction at the Reset address, which redirects the program execution to the appropriate start-up routine.

Note:	Any unimplemented or unused vector locations in the IVT and AIVT should be programmed with the address of a default interrupt handler routine that contains a `RESET` instruction.

FIGURE 13-1: TIMER2/3 AND TIMER4/5 (32-BIT) BLOCK DIAGRAM



Note 1: The 32-Bit Timer Configuration bit, T32, must be set for 32-bit timer/counter operation. All control bits are respective to the T2CON and T4CON registers.

2: The A/D event trigger is available only on Timer2/3 and Timer4/5 in 32-bit mode, and Timer3 and Timer5 in 16-bit mode.

14.0 INPUT CAPTURE WITH DEDICATED TIMERS

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"PIC24F Family Reference Manual"*, **Section 34. "Input Capture with Dedicated Timer"** (DS39722).

All devices in the PIC24FV32KA304 family feature three independent input capture modules. Each of the modules offers a wide range of configuration and operating options for capturing external pulse events, and generating interrupts.

Key features of the input capture module include:

- Hardware-configurable for 32-bit operation in all modes by cascading two adjacent modules
- Synchronous and Trigger modes of output compare operation, with up to 20 user-selectable Sync/trigger sources available
- A 4-level FIFO buffer for capturing and holding timer values for several events
- Configurable interrupt generation
- Up to 6 clock sources available for each module, driving a separate internal 16-bit counter

The module is controlled through two registers: ICxCON1 (Register 14-1) and ICxCON2 (Register 14-2). A general block diagram of the module is shown in Figure 14-1.

14.1 General Operating Modes

14.1.1 SYNCHRONOUS AND TRIGGER MODES

By default, the input capture module operates in a Free-Running mode. The internal 16-bit counter, ICxTMR, counts up continuously, wrapping around from FFFFh to 0000h on each overflow, with its period synchronized to the selected external clock source. When a capture event occurs, the current 16-bit value of the internal counter is written to the FIFO buffer.

In Synchronous mode, the module begins capturing events on the ICx pin as soon as its selected clock source is enabled. Whenever an event occurs on the selected Sync source, the internal counter is reset. In Trigger mode, the module waits for a Sync event from another internal module to occur before allowing the internal counter to run.

Standard, free-running operation is selected by setting the SYNCSELx bits to '00000' and clearing the ICTRIG bit (ICxCON2<7>). Synchronous and Trigger modes are selected any time the SYNCSELx bits are set to any value except '00000'. The ICTRIG bit selects either Synchronous or Trigger mode; setting the bit selects Trigger mode operation. In both modes, the SYNCSELx bits determine the Sync/trigger source.

When the SYNCSELx bits are set to '00000' and ICTRIG is set, the module operates in Software Trigger mode. In this case, capture operations are started by manually setting the TRIGSTAT bit (ICxCON2<6>).

PWCSAMP7	PWCSAMP6	PWCSAMP5	PWCSAMP4	PWCSAMP3	PWCSAMP2	PWCSAMP1	PWCSAMP0
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15-8 **PWCSTAB<7:0>:** PWM Stability Window Timer bits

11111111 = Stability window is 255 TPWCCLK clock periods

.

.

.

00000000 = Stability window is 0 TPWCCLK clock periods

The sample window starts when the alarm event triggers. The stability window timer starts counting from every alarm event when PWCEN = 1.

bit 7-0 **PWCSAMP<7:0>:** PWM Sample Window Timer bits

11111111 = Sample window is always enabled, even when PWCEN = 0

11111110 = Sample window is 254 TPWCCLK clock periods

.

.

.

00000000 = Sample window is 0 TPWCCLK clock periods

The sample window timer starts counting at the end of the stability window when PWCEN = 1. If PWCSTAB<7:0> = 00000000, the sample window timer starts counting from every alarm event when PWCEN = 1.

Note 1: A write to this register is only allowed when RTCWREN = 1.

- 0 = Band gap is not enabled by the A/D

bit 11 **Reserved:** Maintain as '0'

bit 10 **Unimplemented:** Read as '0'

bit 9-8 **ASINT<1:0>:** Auto-Scan (Threshold Detect) Interrupt Mode bits
- 11 = Interrupt after a Threshold Detect sequence completed and a valid compare has occurred
- 10 = Interrupt after a valid compare has occurred
- 01 = Interrupt after a Threshold Detect sequence completed
- 00 = No interrupt

bit 7-4 **Unimplemented:** Read as '0'

bit 3-2 **WM<1:0>:** Write Mode bits
- 11 = Reserved
- 10 = Auto-compare only (conversion results are not saved, but interrupts are generated when a valid match, as defined by the CMx and ASINTx bits, occurs)
- 01 = Convert and save (conversion results are saved to locations as determined by the register bits when a match, as defined by the CMx bits, occurs)
- 00 = Legacy operation (conversion data is saved to a location determined by the buffer register bits)

bit 1-0 **CM<1:0>:** Compare Mode bits
- 11 = Outside Window mode (valid match occurs if the conversion result is outside of the window defined by the corresponding buffer pair)
- 10 = Inside Window mode (valid match occurs if the conversion result is inside the window defined by the corresponding buffer pair)
- 01 = Greater Than mode (valid match occurs if the result is greater than the value in the corresponding buffer register)
- 00 = Less Than mode (valid match occurs if the result is less than the value in the corresponding buffer register)

Note 1: When using auto-scan with Threshold Detect (ASEN = 1), do not configure the sample clock source to Auto-Convert mode (SSRCx = 7). Any other available SSRCx selection is valid. To use auto-convert as the sample clock source (SSRCx = 7), make sure ASEN is cleared.

bit 23							bit 16

U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
—	—	—	—	—	—	—	—
bit 15							bit 8

U-0	U-0	U-0	U-0	R	R	R	R
—	—	—	—	REV3	REV2	REV1	REV0
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as ‘0’	
-n = Value at POR	‘1’ = Bit is set	‘0’ = Bit is cleared	x = Bit is unknown

bit 23-4 **Unimplemented:** Read as ‘0’

bit 3-0 **REV<3:0>:** Minor Revision Identifier bits

FIGURE 29-8: TIMER1/2/3/4/5 EXTERNAL CLOCK INPUT TIMING

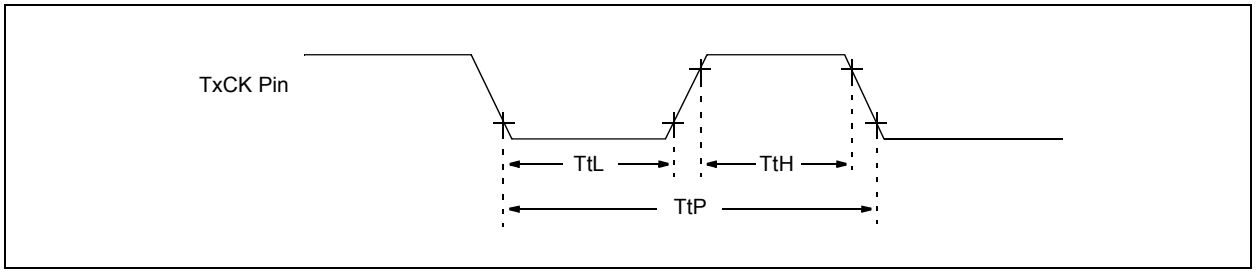

TABLE 29-27: TIMER1/2/3/4/5 EXTERNAL CLOCK INPUT REQUIREMENTS

Param. No.	Symbol	Characteristic		Min	Max	Units	Conditions
	TtH	TxCK High Pulse Time	Sync w/Prescaler	TCY + 20	—	ns	Must also meet Parameter Ttp
			Async w/Prescaler	10	—	ns	
			Async Counter	20	—	ns	
	TtL	TxCK Low Pulse Time	Sync w/Prescaler	TCY + 20	—	ns	Must also meet Parameter Ttp
			Async w/Prescaler	10	—	ns	
			Async Counter	20	—	ns	
	TtP	TxCK External Input Period	Sync w/Prescaler	2 * TCY + 40	—	ns	N = Prescale Value (1, 4, 8, 16)
			Async w/Prescaler	Greater of: 20 or $\frac{2 * T_{CY} + 40}{N}$	—	ns	
			Async Counter	40	—	ns	
		Delay for Input Edge to Timer Increment	Synchronous	1	2	TCY	
			Asynchronous	—	20	ns	

FIGURE 29-9: INPUT CAPTURE x TIMINGS

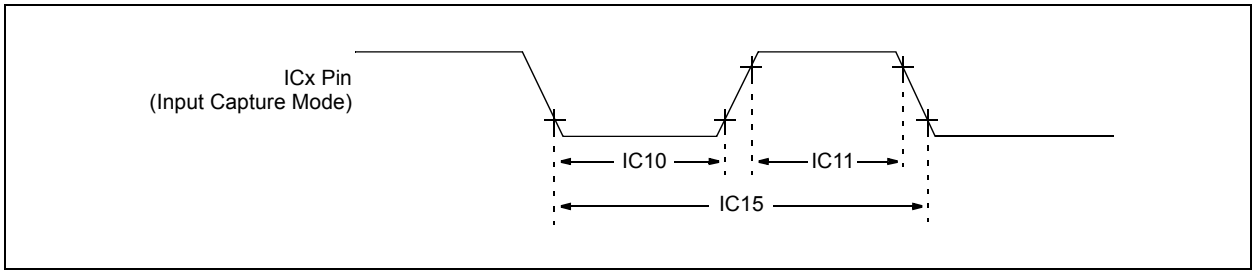

TABLE 29-28: INPUT CAPTURE x REQUIREMENTS

Param. No.	Symbol	Characteristic		Min	Max	Units	Conditions
IC10	TccL	ICx Input Low Time – Synchronous Timer	No Prescaler	TCY + 20	—	ns	Must also meet Parameter IC15
			With Prescaler	20	—	ns	
IC11	TccH	ICx Input Low Time – Synchronous Timer	No Prescaler	TCY + 20	—	ns	Must also meet Parameter IC15
			With Prescaler	20	—	ns	
IC15	TccP	ICx Input Period – Synchronous Timer		$\frac{2 * T_{CY} + 40}{N}$	—	ns	N = prescale value (1, 4, 16)

TABLE 29-40: A/D MODULE SPECIFICATIONS

AC CHARACTERISTICS			Standard Operating Conditions: 1.8V to 3.6V PIC24F32KA3XX 2.0V to 5.5V PIC24FV32KA3XX Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param No.	**Symbol**	**Characteristic**	**Min.**	**Typ**	**Max.**	**Units**	**Conditions**
Device Supply							
AD01	AVDD	Module VDD Supply	Greater of: VDD – 0.3 or 1.8	—	Lesser of: VDD + 0.3 or 3.6	V	PIC24FXXKA30X devices
			Greater of: VDD – 0.3 or 2.0	—	Lesser of: VDD + 0.3 or 5.5	V	PIC24FVXXKA30X devices
AD02	AVSS	Module VSS Supply	VSS – 0.3	—	VSS + 0.3	V	
Reference Inputs							
AD05	VREFH	Reference Voltage High	AVSS + 1.7	—	AVDD	V	
AD06	VREFL	Reference Voltage Low	AVSS	—	AVDD – 1.7	V	
AD07	VREF	Absolute Reference Voltage	AVSS – 0.3	—	AVDD + 0.3	V	
AD08	IVREF	Reference Voltage Input Current	—	1.25	—	mA	
AD09	ZVREF	Reference Input Impedance	—	10k	—	Ω	
Analog Input							
AD10	VINH-VINL	Full-Scale Input Span	VREFL	—	VREFH	V	**(Note 2)**
AD11	VIN	Absolute Input Voltage	AVSS – 0.3	—	AVDD + 0.3	V	
AD12	VINL	Absolute VINL Input Voltage	AVSS – 0.3	—	AVDD/2	V	
AD17	RIN	Recommended Impedance of Analog Voltage Source	—	—	1k	Ω	12-bit
A/D Accuracy							
AD20b	NR	Resolution	—	12	—	bits	
AD21b	INL	Integral Nonlinearity	—	±1	±9	LSb	VINL = AVSS = VREFL = 0V, AVDD = VREFH = 5V
AD22b	DNL	Differential Nonlinearity	—	±1	±5	LSb	VINL = AVSS = VREFL = 0V, AVDD = VREFH = 5V
AD23b	GERR	Gain Error	—	±1	±9	LSb	VINL = AVSS = VREFL = 0V, AVDD = VREFH = 5V
AD24b	EOFF	Offset Error	—	±1	±5	LSb	VINL = AVSS = VREFL = 0V, AVDD = VREFH = 5V
AD25b		Monotonicity(1)	—	—	—	—	Guaranteed

Note 1: The A/D conversion result never decreases with an increase in the input voltage.

2: Measurements are taken with external VREF+ and VREF- used as the A/D voltage reference.

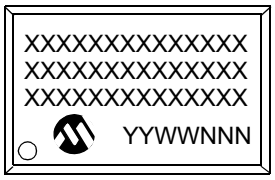
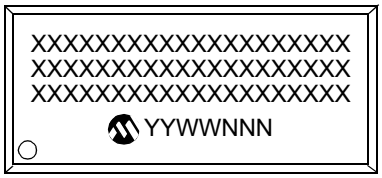
20-Lead SOIC (7.50 mm)

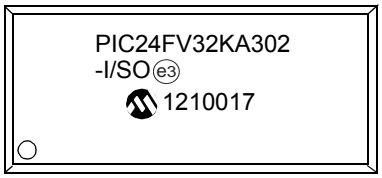


Example

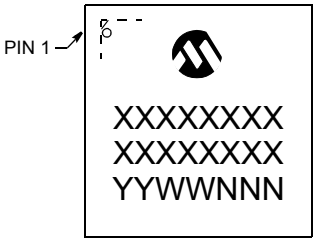
28-Lead SOIC (7.50 mm)



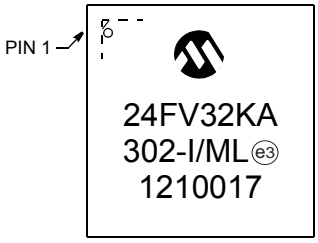
Example



28-Lead QFN (6x6 mm)

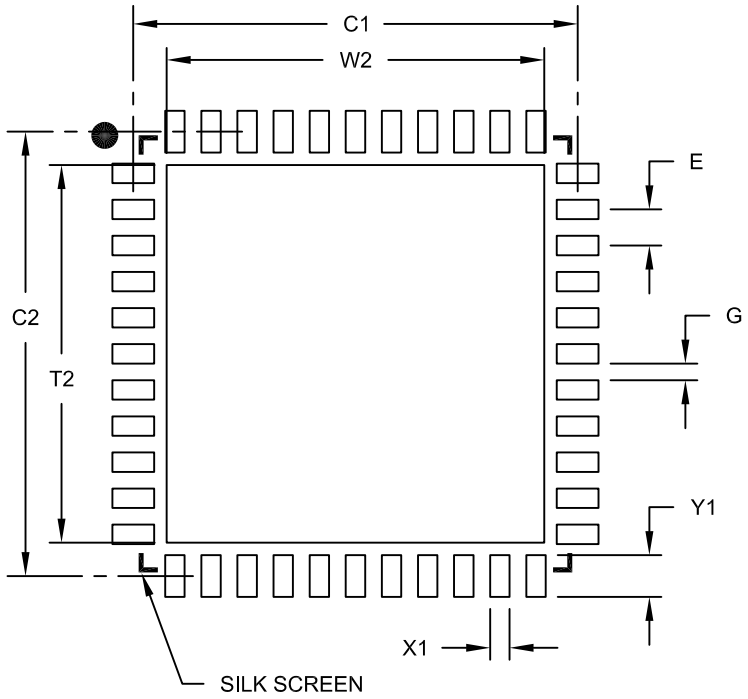


Example



44-Lead Plastic Quad Flat, No Lead Package (ML) - 8x8 mm Body [QFN]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



RECOMMENDED LAND PATTERN

Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Contact Pitch	E		0.65 BSC	
Optional Center Pad Width	W2			6.60
Optional Center Pad Length	T2			6.60
Contact Pad Spacing	C1		8.00	
Contact Pad Spacing	C2		8.00	
Contact Pad Width (X44)	X1			0.35
Contact Pad Length (X44)	Y1			0.85
Distance Between Pads	G	0.25		

Notes:

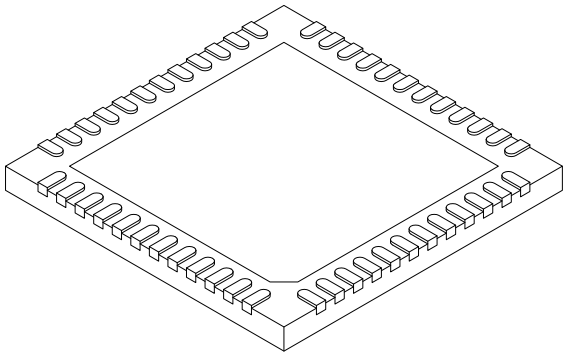
1. Dimensioning and tolerancing per ASME Y14.5M

BSC: Basic Dimension. Theoretically exact value shown without tolerances.

Microchip Technology Drawing No. C04-2103B

48-Lead Plastic Ultra Thin Quad Flat, No Lead Package (MV) – 6x6x0.5 mm Body [UQFN]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Number of Pins	N		48	
Pitch	e		0.40 BSC	
Overall Height	A	0.45	0.50	0.55
Standoff	A1	0.00	0.02	0.05
Contact Thickness	A3		0.127 REF	
Overall Width	E		6.00 BSC	
Exposed Pad Width	E2	4.45	4.60	4.75
Overall Length	D		6.00 BSC	
Exposed Pad Length	D2	4.45	4.60	4.75
Contact Width	b	0.15	0.20	0.25
Contact Length	L	0.30	0.40	0.50
Contact-to-Exposed Pad	K	0.20	-	-

Notes:

1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. Package is saw singulated.
3. Dimensioning and tolerancing per ASME Y14.5M.

   BSC: Basic Dimension. Theoretically exact value shown without tolerances.

   REF: Reference Dimension, usually without tolerance, for information purposes only.
