Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

iCE40 LP/HX Family Data Sheet Introduction

March 2017 Data Sheet DS1040

Features

- **Flexible Logic Architecture**
  - Five devices with 384 to 7,680 LUT4s and 10 to 206 I/Os
- **Ultra Low Power Devices**
  - Advanced 40 nm low power process
  - As low as 21 µA standby power
  - Programmable low swing differential I/Os
- **Embedded and Distributed Memory**
  - Up to 128 kbits sysMEM™ Embedded Block RAM
- **Pre-Engineered Source Synchronous I/O**
  - DDR registers in I/O cells
- **High Current LED Drivers**
  - Three High Current Drivers used for three different LEDs or one RGB LED
- **High Performance, Flexible I/O Buffer**
  - Programmable sysIO™ buffer supports wide range of interfaces:
    - LVCMOS 3.3/2.5/1.8
    - LVDS25E, subLVDS
    - Schmitt trigger inputs, to 200 mV typical hysteresis
  - Programmable pull-up mode
- **Flexible On-Chip Clocking**
  - Eight low-skew global clock resources
  - Up to two analog PLLs per device
- **Flexible Device Configuration**
  - SRAM is configured through:
    - Standard SPI Interface
    - Internal Nonvolatile Configuration Memory (NVCM)
- **Broad Range of Package Options**
  - WLCSP, QFN, VQFP, TQFP, ucBGA, caBGA, and csBGA package options
  - Small footprint package options
    - As small as 1.40 mm x 1.48 mm
  - Advanced halogen-free packaging

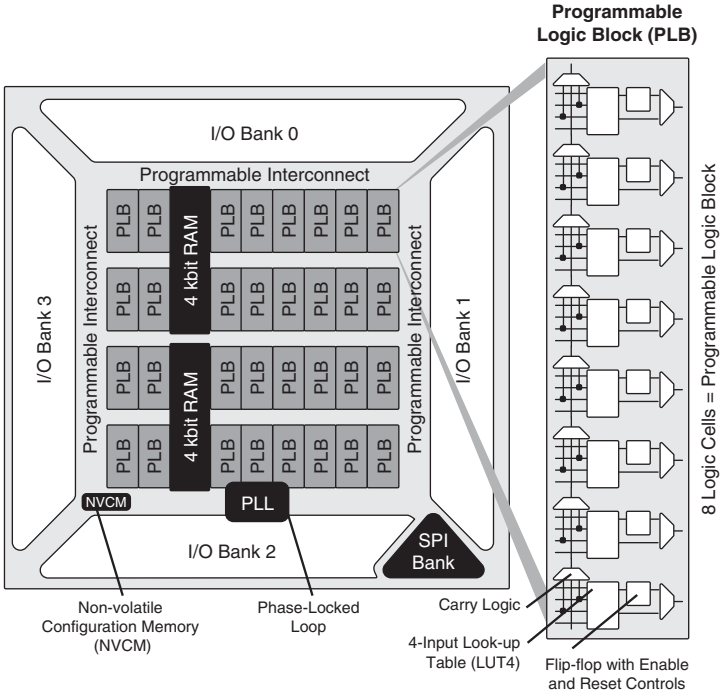
iCE40 LP/HX Family Data Sheet Architecture

March 2017 Data Sheet DS1040

Architecture Overview

The iCE40 family architecture contains an array of Programmable Logic Blocks (PLB), sysCLOCK™ PLLs, Non-volatile Programmable Configuration Memory (NVCM) and blocks of sysMEM™ Embedded Block RAM (EBR) surrounded by Programmable I/O (PIO). Figure 2-1 shows the block diagram of the iCE40LP/HX1K device.

Figure 2-1. iCE40LP/HX1K Device, Top View



The logic blocks, Programmable Logic Blocks (PLB) and sysMEM EBR blocks, are arranged in a two-dimensional grid with rows and columns. Each column has either logic blocks or EBR blocks. The PIO cells are located at the periphery of the device, arranged in banks. The PLB contains the building blocks for logic, arithmetic, and register functions. The PIOs utilize a flexible I/O buffer referred to as a sysIO buffer that supports operation with a variety of interface standards. The blocks are connected with many vertical and horizontal routing channel resources. The place and route software tool automatically allocates these routing resources.

In the iCE40 family, there are up to four independent sysIO banks. Note on some packages V_{CCIO} banks are tied together. There are different types of I/O buffers on the different banks. Refer to the details in later sections of this document. The sysMEM EBRs are large 4 kbit, dedicated fast memory blocks. These blocks can be configured as RAM, ROM or FIFO.

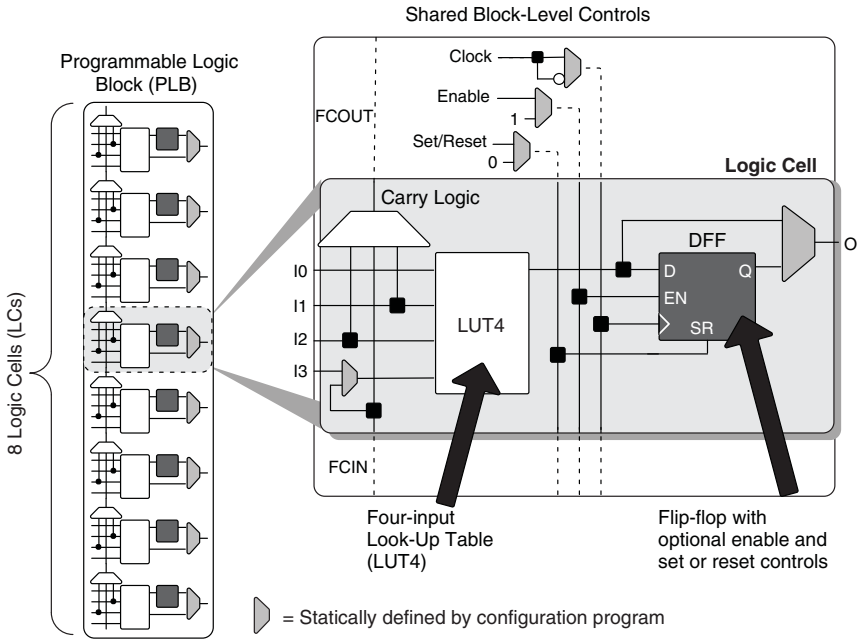
The iCE40 architecture also provides up to two sysCLOCK Phase Locked Loop (PLL) blocks. The PLLs have multiply, divide, and phase shifting capabilities that are used to manage the frequency and phase relationships of the clocks.

Every device in the family has a SPI port that supports programming and configuration of the device. The iCE40 includes on-chip, Nonvolatile Configuration Memory (NVCM).

PLB Blocks

The core of the iCE40 device consists of Programmable Logic Blocks (PLB) which can be programmed to perform logic and arithmetic functions. Each PLB consists of eight interconnected Logic Cells (LC) as shown in Figure 2-2. Each LC contains one LUT and one register.

Figure 2-2. PLB Block Diagram



Logic Cells

Each Logic Cell includes three primary logic elements shown in Figure 2-2.

- A four-input Look-Up Table (LUT4) builds any combinational logic function, of any complexity, requiring up to four inputs. Similarly, the LUT4 element behaves as a 16x1 Read-Only Memory (ROM). Combine and cascade multiple LUT4s to create wider logic functions.
- A 'D'-style Flip-Flop (DFF), with an optional clock-enable and reset control input, builds sequential logic functions. Each DFF also connects to a global reset signal that is automatically asserted immediately following device configuration.
- Carry Logic boosts the logic efficiency and performance of arithmetic functions, including adders, subtractors, comparators, binary counters and some wide, cascaded logic functions.

Table 2-1. Logic Cell Signal Descriptions

Function	Type	Signal Names	Description
Input	Data signal	I0, I1, I2, I3	Inputs to LUT4
Input	Control signal	Enable	Clock enable shared by all LCs in the PLB
Input	Control signal	Set/Reset[1]	Asynchronous or synchronous local set/reset shared by all LCs in the PLB.
Input	Control signal	Clock	Clock one of the eight Global Buffers, or from the general-purpose interconnects fabric shared by all LCs in the PLB
Input	Inter-PLB signal	FCIN	Fast carry in
Output	Data signals	O	LUT4 or registered output
Output	Inter-PFU signal	FCOUT	Fast carry out

1. If Set/Reset is not used, then the flip-flop is never set/reset, except when cleared immediately after configuration.

Routing

There are many resources provided in the iCE40 devices to route signals individually with related control signals. The routing resources consist of switching circuitry, buffers and metal interconnect (routing) segments.

The inter-PLB connections are made with three different types of routing resources: Adjacent (spans two PLBs), x4 (spans five PLBs) and x12 (spans thirteen PLBs). The Adjacent, x4 and x12 connections provide fast and efficient connections in the diagonal, horizontal and vertical directions.

The design tool takes the output of the synthesis tool and places and routes the design.

Clock/Control Distribution Network

Each iCE40 device has eight global inputs, two pins on each side of the device. Note that not all GBINs are available in all packages.

These global inputs can be used as high fanout nets, clock, reset or enable signals. The dedicated global pins are identified as GBIN[7:0] and the global buffers are identified as-GBUF[7:0]. These eight inputs may be used as general purpose I/O if they are not used to drive the clock nets. Global buffer GBUF7 in I/O Bank 3 also provides an optional direct LVDS25 or subLVDS differential clock input.

Table 2-2 lists the connections between a specific global buffer and the inputs on a PLB. All global buffers optionally connect to the PLB CLK input. Any four of the eight global buffers can drive logic inputs to a PLB. Even-numbered global buffers optionally drive the Set/Reset input to a PLB. Similarly, odd-numbered buffers optionally drive the PLB clock-enable input.

Table 2-2. Global Buffer (GBUF) Connections to Programmable Logic Blocks

Global Buffer	LUT Inputs	Clock	Reset	Clock Enable
GBUF0	Yes, any 4 of 8 GBUF Inputs	Yes	Yes	
GBUF1		Yes		Yes
GBUF2		Yes	Yes	
GBUF3		Yes		Yes
GBUF4		Yes	Yes	
GBUF5		Yes		Yes
GBUF6		Yes	Yes	
GBUF7		Yes		Yes

The maximum frequency for the global buffers are shown in the iCE40 External Switching Characteristics tables later in this document.

Global Hi-Z Control

The global high-impedance control signal, GHIZ, connects to all I/O pins on the iCE40 device. This GHIZ signal is automatically asserted throughout the configuration process, forcing all user I/O pins into their high-impedance state.

Global Reset Control

The global reset control signal connects to all PLB and PIO flip-flops on the iCE40 device. The global reset signal is automatically asserted throughout the configuration process, forcing all flip-flops to their defined wake-up state. For PLB flip-flops, the wake-up state is always reset, regardless of the PLB flip-flop primitive used in the application.

sysCLOCK Phase Locked Loops (PLLs)

The sysCLOCK PLLs provide the ability to synthesize clock frequencies. The iCE40 devices have one or more sysCLOCK PLLs. REFERENCECLK is the reference frequency input to the PLL and its source can come from an external I/O pin or from internal routing. EXTFEEDBACK is the feedback signal to the PLL which can come from internal routing or an external I/O pin. The feedback divider is used to multiply the reference frequency and thus synthesize a higher frequency clock output.

The PLLOUT output has an output divider, thus allowing the PLL to generate different frequencies for each output. The output divider can have a value from 1 to 6. The PLLOUT outputs can all be used to drive the iCE40 global clock network directly or general purpose routing resources can be used.

The LOCK signal is asserted when the PLL determines it has achieved lock and de-asserted if a loss of lock is detected. A block diagram of the PLL is shown in Figure 2-3.

The timing of the device registers can be optimized by programming a phase shift into the PLLOUT output clock which will advance or delay the output clock with reference to the REFERENCECLK clock. This phase shift can be either programmed during configuration or can be adjusted dynamically. In dynamic mode, the PLL may lose lock after a phase adjustment on the output used as the feedback source and not relock until the t_{LOCK} parameter has been satisfied.

For more details on the PLL, see TN1251, iCE40 sysCLOCK PLL Design and Usage Guide.

Figure 2-3. PLL Diagram

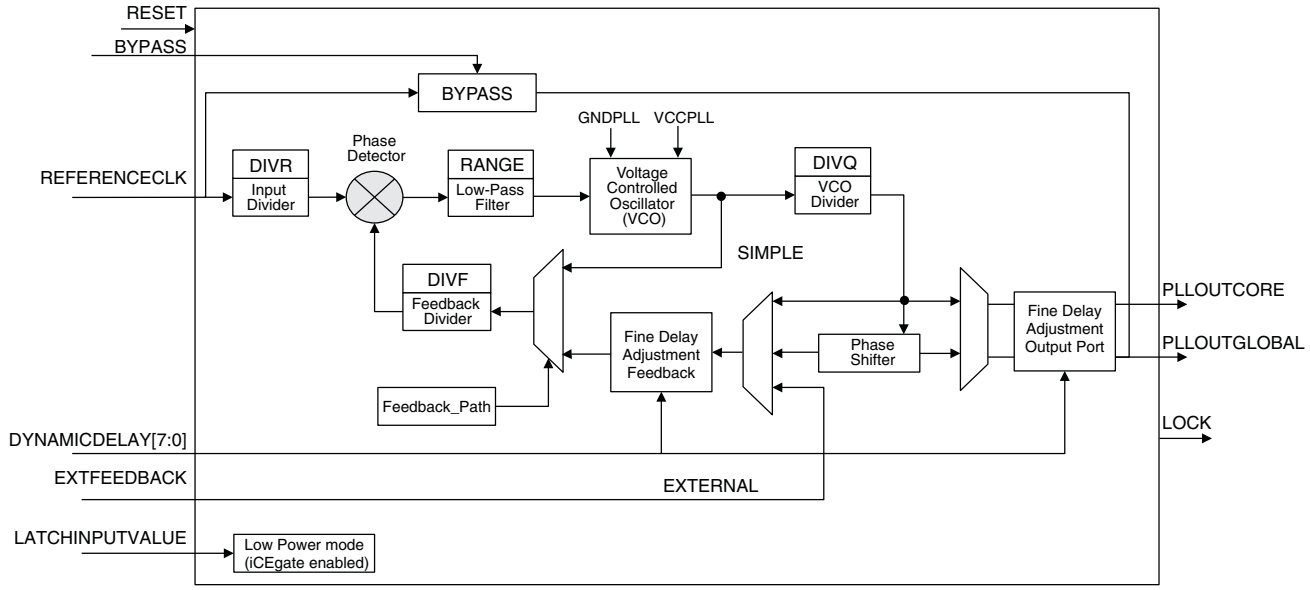


Table 2-3 provides signal descriptions of the PLL block.

RAM Initialization and ROM Operation

If desired, the contents of the RAM can be pre-loaded during device configuration.

By preloading the RAM block during the chip configuration cycle and disabling the write controls, the sysMEM block can also be utilized as a ROM.

Note the sysMEM Embedded Block RAM Memory address 0 cannot be initialized.

Memory Cascading

Larger and deeper blocks of RAM can be created using multiple EBR sysMEM Blocks.

RAM4k Block

Figure 2-4 shows the 256x16 memory configurations and their input/output names. In all the sysMEM RAM modes, the input data and addresses for the ports are registered at the input of the memory array.

sysIO Buffer

Each I/O is associated with a flexible buffer referred to as a sysIO buffer. These buffers are arranged around the periphery of the device in groups referred to as banks. The sysIO buffers allow users to implement a wide variety of standards that are found in today's systems including LVCMOS and LVDS25.

High Current LED Drivers combine three sysIO buffers together. This allows for programmable drive strength. This also allows for high current drivers that are ideal to drive three white LEDs, or one RGB LED. Each bank is capable of supporting multiple I/O standards including single-ended LVCMOS buffers and differential LVDS25E output buf-

Power Supply Ramp Rates[1, 2]

Symbol	Parameter		Min.	Max.	Units
t_{RAMP}	Power supply ramp rates for all power supplies.	All configuration modes. No power supply sequencing.	0.40	10	V/ms

Signal Descriptions

Signal Name	I/O	Descriptions
General Purpose		
IO[Bank]_[Row/Column Number][A/B]	I/O	[Bank] indicates the bank of the device on which the pad is located. [Number] indicates IO number on the device.
IO[Bank]_[Row/Column Number][A/B]	I/O	[Bank] indicates the bank of the device on which the pad is located. [Number] indicates IO number on the device. [A/B] indicates the differential I/O. 'A' = negative input. 'B' = positive input.
HCIO[Bank]_[Number]	I/O	High Current IO. [Bank] indicates the bank of the device on which the pad is located. [Number] indicates IO number.
NC	—	No connect
GND	—	GND – Ground. Dedicated pins. It is recommended that all GNDs are tied together.
VCC	—	VCC – The power supply pins for core logic. Dedicated pins. It is recommended that all VCCs are tied to the same supply.
VCCIO_x	—	VCCIO – The power supply pins for I/O Bank x. Dedicated pins. All VCCIOs located in the same bank are tied to the same supply.
PLL and Global Functions (Used as user-programmable I/O pins when not used for PLL or clock pins)		
VCCPLLx	—	PLL VCC – Power. Dedicated pins. The PLL requires a separate power and ground that is quiet and stable to reduce the output clock jitter of the PLL.
GNDPLLx	—	PLL GND – Ground. Dedicated pins. The sysCLOCK PLL has the DC ground connection made on the FPGA, so the external PLL ground connection (GNDPLL) must NOT be connected to the board's ground.
GBINx	—	Global pads. Two per side.
Programming and Configuration		
CBSEL[0:1]	I/O	Dual function pins. I/Os when not used as CBSEL. Optional ColdBoot configuration SELect input, if ColdBoot mode is enabled.
CRESET_B	I	Configuration Reset, active Low. Dedicated input. No internal pull-up resistor. Either actively drive externally or connect a 10 KOhm pull-up resistor to VCCIO_2.
CDONE	I/O	Configuration Done. Includes a permanent weak pull-up resistor to VCCIO_2. If driving external devices with CDONE output, an external pull-up resistor to VCCIO_2 may be required. Refer to the TN1248, iCE40 Programming and Configuration for more details. Following device configuration the iCE40LP640 and iCE40LP1K in the SWG16 package CDONE pin can be used as a user output.
VCC_SPI	—	SPI interface voltage supply input. Must have a valid voltage even if configuring from NVCM.
SPI_SCK	I/O	Input Configuration Clock for configuring an FPGA in Slave SPI mode. Output Configuration Clock for configuring an FPGA configuration modes.
SPI_SS_B	I/O	SPI Slave Select. Active Low. Includes an internal weak pull-up resistor to VCC_SPI during configuration. During configuration, the logic level sampled on this pin determines the configuration mode used by the iCE40 device. An input when sampled at the start of configuration. An input when in SPI Peripheral configuration mode (SPI_SS_B = Low). An output when in Master SPI Flash configuration mode.
SPI_SI	I/O	Slave SPI serial data input and master SPI serial data output
SPI_SO	I/O	Slave SPI serial data output and master SPI serial data input

Signal Descriptions (Continued)

Signal Name	I/O	Descriptions
VPP_FAST	—	Optional fast NVCM programming supply. V_{PP_FAST}, used only for fast production programming, must be left floating or unconnected in applications, except CM36 and CM49 packages MUST have the V_{PP_FAST} ball connected to V_{CCIO_0} ball externally.
VPP_2V5	—	VPP_2V5 NVCM programming and operating supply

iCE40 LP/HX Family Data Sheet Revision History

March 2017 **Data Sheet DS1040**

Date	Version	Section	Change Summary
March 2017	3.3	Introduction	Updated Features section. Added 121-ball caBGA package for ICE40 HX4K/8K to Table 1-1, iCE40 Family Selection Guide.
		Architecture	Updated PLB Blocks section. Changed “subtracters” to “subtractors” in the Carry Logic description.
			Updated Clock/Control Distribution Network section. Switched the “Clock Enable“ and the “Reset” headings in Table 2-2, Global Buffer (GBUF) Connections to Programmable Logic Blocks.
		Pinout Information	Updated Pin Information Summary section. Added BG121information under iCE40HX4K and iCE40HX8K.
		Ordering Information	Updated iCE40 Part Number Description section. Added Shipping Method and BG121 package under High Performance (HX) Devices.
			Updated Ordering Information section. Added part numbers for BG121 under High-Performance Industrial Grade Devices, Halogen Free (RoHS) Packaging.
		Supplemental Information	Corrected reference to “Package Diagrams Data Sheet”.
October 2015	3.2	Introduction	Updated Features section. Added footnote to 16 WLCSP Programmable I/O: Max Inputs (LVDS25) in Table 1-1, iCE40 Family Selection Guide.
		DC and Switching Characteristics	Updated sysCLOCK PLL Timing section. Changed t_{DT} conditions.
			Updated Programming NVCM Supply Current – LP Devices section. Changed I_{PP_2V5} and I_{CCIO}, I_{CC_SPI} units.
March 2015	3.1	DC and Switching Characteristics	Updated sysIO Single-Ended DC Electrical Characteristics section. Changed LVCMOS 3.3 and LVCMOS 2. 5 V_{OH} Min. (V) from 0.5 to 0.4.
July 2014	3.0	DC and Switching Characteristics	Revised and/or added Typ. V_{CC} data in the following sections. — Static Supply Current – LP Devices — Static Supply Current – HX Devices — Programming NVCM Supply Current – LP Devices — Programming NVCM Supply Current – HX Devices In each section table, the footnote indicating Advanced device status was removed.
		Pinout Information	Updated Pin Information Summary section. Added footnote 1 to CM49 under iCE40LP1K.
April 2014	02.9	Ordering Information	Changed “i” to “I” in part number description and ordering part numbers.
			Added part numbers to the Ultra Low Power Industrial Grade Devices, Halogen Free (RoHS) Packaging table.

Date	Version	Section	Change Summary
February 2014	02.8	Introduction	Updated Features section. — Corrected standby power units. — Included High Current LED Drivers
			Updated Table 1-1, iCE40 Family Selection Guide. — Removed LP384 Programmable I/O for 81 ucBGA package.
		Architecture	Updated Supported Standards section. Added information on High Current LED drivers.
		DC and Switching Characteristics	Corrected typos.
			Added footnote to the Peak Startup Supply Current – LP Devices table.
		Ordering Information	Updated part number description in the Ultra Low Power (LP) Devices section.
			Added part numbers to the Ultra Low Power Industrial Grade Devices, Halogen Free (RoHS) Packaging table.
October 2013	02.7	Introduction	Updated Features list and iCE40 Family Selection Guide table.
		Architecture	Revised iCE40-1K device to iCE40LP/HX1K device.
		DC and Switching Characteristics	Added iCE40LP640 device information.
		Pinout Information	Added iCE40LP640 and iCE40LP1K information.
		Ordering Information	Added iCE40LP640 and iCE40LP1K information.
September 2013	02.6	DC and Switching Characteristics	Updated Absolute Maximum Ratings section.
			Updated sysCLOCK PLL Timing – Preliminary table.
		Pinout Information	Updated Pin Information Summary table.
August 2013	02.5	Introduction	Updated the iCE40 Family Selection Guide table.
		DC and Switching Characteristics	Updated the following tables: — Absolute Maximum Ratings — Power-On-Reset Voltage Levels — Static Supply Current – LP Devices — Static Supply Current – HX Devices — Programming NVCM Supply Current – LP Devices — Programming NVCM Supply Current – HX Devices — Peak Startup Supply Current – LP Devices — sysIO Recommended Operating Conditions — Typical Building Block Function Performance – HX Devices — iCE40 External Switching Characteristics – HX Devices — sysCLOCK PLL Timing – Preliminary — SPI Master or NVCM Configuration Time
		Pinout Information	Updated the Pin Information Summary table.
July 2013	02.4	Introduction	Updated the iCE40 Family Selection Guide table.
		DC and Switching Characteristics	Updated the sysCONFIG Port Timing Specifications table.
			Updated footnote in DC Electrical Characteristics table.
			GDDR tables removed. Support to be provided in a technical note.
		Pinout Information	Updated the Pin Information Summary table.
		Ordering Information	Updated the top-side markings figure.
			Updated the Ultra Low Power Industrial Grade Devices, Halogen Free (RoHS) Packaging table.
May 2013	02.3	DC and Switching Characteristics	Added new data from Characterization.
