Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Introduction

The iCE40 family of ultra-low power, non-volatile FPGAs has five devices with densities ranging from 384 to 7680 Look-Up Tables (LUTs). In addition to LUT-based, low-cost programmable logic, these devices feature Embedded Block RAM (EBR), Non-volatile Configuration Memory (NVCM) and Phase Locked Loops (PLLs). These features allow the devices to be used in low-cost, high-volume consumer and system applications. Select packages offer High-Current drivers that are ideal to drive three white LEDs, or one RGB LED.

The iCE40 devices are fabricated on a 40 nm CMOS low power process. The device architecture has several features such as programmable low-swing differential I/Os and the ability to turn off on-chip PLLs dynamically. These features help manage static and dynamic power consumption, resulting in low static power for all members of the family. The iCE40 devices are available in two versions – ultra low power (LP) and high performance (HX) devices.

The iCE40 FPGAs are available in a broad range of advanced halogen-free packages ranging from the space saving 1.40x1.48 mm WLCSP to the PCB-friendly 20x20 mm TQFP. Table 1-1 shows the LUT densities, package and I/O options, along with other key parameters.

The iCE40 devices offer enhanced I/O features such as pull-up resistors. Pull-up features are controllable on a "per-pin" basis.

The iCE40 devices also provide flexible, reliable and secure configuration from on-chip NVCM. These devices can also configure themselves from external SPI Flash or be configured by an external master such as a CPU.

Lattice provides a variety of design tools that allow complex designs to be efficiently implemented using the iCE40 family of devices. Popular logic synthesis tools provide synthesis library support for iCE40. Lattice design tools use the synthesis tool output along with the user-specified preferences and constraints to place and route the design in the iCE40 device. These tools extract the timing from the routing and back-annotate it into the design for timing verification.

Lattice provides many pre-engineered IP (Intellectual Property) modules, including a number of reference designs, licensed free of charge, optimized for the iCE40 FPGA family. By using these configurable soft core IP cores as standardized blocks, users are free to concentrate on the unique aspects of their design, increasing their productivity.

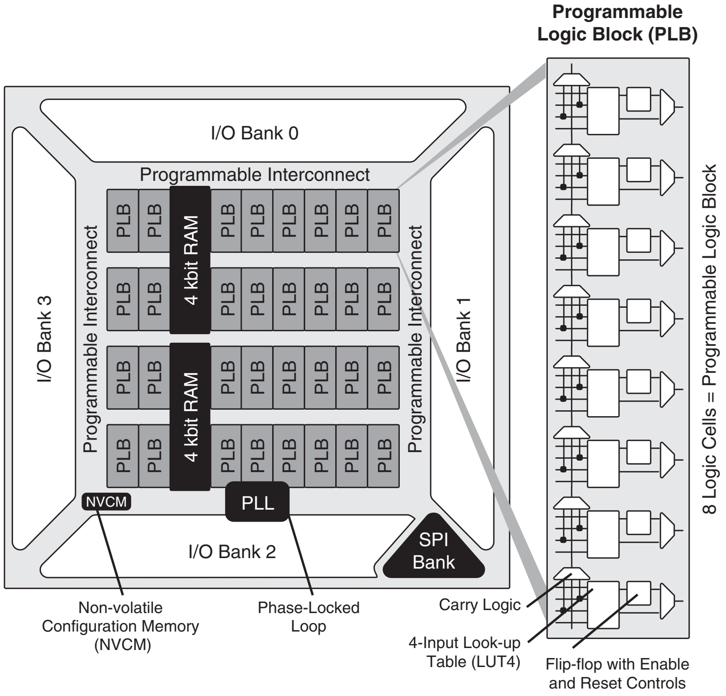
iCE40 LP/HX Family Data Sheet
Architecture

March 2017 **Data Sheet DS1040**

Architecture Overview

The iCE40 family architecture contains an array of Programmable Logic Blocks (PLB), sysCLOCK™ PLLs, Non-volatile Programmable Configuration Memory (NVCM) and blocks of sysMEM™ Embedded Block RAM (EBR) surrounded by Programmable I/O (PIO). Figure 2-1 shows the block diagram of the iCE40LP/HX1K device.

Figure 2-1. iCE40LP/HX1K Device, Top View



The logic blocks, Programmable Logic Blocks (PLB) and sysMEM EBR blocks, are arranged in a two-dimensional grid with rows and columns. Each column has either logic blocks or EBR blocks. The PIO cells are located at the periphery of the device, arranged in banks. The PLB contains the building blocks for logic, arithmetic, and register functions. The PIOs utilize a flexible I/O buffer referred to as a sysIO buffer that supports operation with a variety of interface standards. The blocks are connected with many vertical and horizontal routing channel resources. The place and route software tool automatically allocates these routing resources.

In the iCE40 family, there are up to four independent sysIO banks. Note on some packages V_{CCIO} banks are tied together. There are different types of I/O buffers on the different banks. Refer to the details in later sections of this document. The sysMEM EBRs are large 4 kbit, dedicated fast memory blocks. These blocks can be configured as RAM, ROM or FIFO.

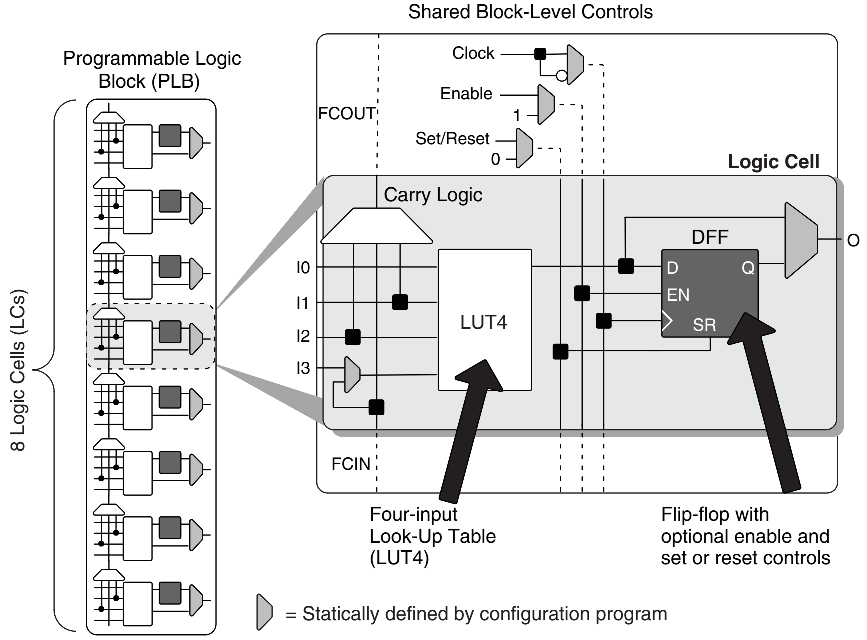
The iCE40 architecture also provides up to two sysCLOCK Phase Locked Loop (PLL) blocks. The PLLs have multiply, divide, and phase shifting capabilities that are used to manage the frequency and phase relationships of the clocks.

Every device in the family has a SPI port that supports programming and configuration of the device. The iCE40 includes on-chip, Nonvolatile Configuration Memory (NVCM).

PLB Blocks

The core of the iCE40 device consists of Programmable Logic Blocks (PLB) which can be programmed to perform logic and arithmetic functions. Each PLB consists of eight interconnected Logic Cells (LC) as shown in Figure 2-2. Each LC contains one LUT and one register.

Figure 2-2. PLB Block Diagram



Logic Cells

Each Logic Cell includes three primary logic elements shown in Figure 2-2.

- A four-input Look-Up Table (LUT4) builds any combinational logic function, of any complexity, requiring up to four inputs. Similarly, the LUT4 element behaves as a 16x1 Read-Only Memory (ROM). Combine and cascade multiple LUT4s to create wider logic functions.
- A 'D'-style Flip-Flop (DFF), with an optional clock-enable and reset control input, builds sequential logic functions. Each DFF also connects to a global reset signal that is automatically asserted immediately following device configuration.
- Carry Logic boosts the logic efficiency and performance of arithmetic functions, including adders, subtractors, comparators, binary counters and some wide, cascaded logic functions.

Table 2-1. Logic Cell Signal Descriptions

Function	Type	Signal Names	Description
Input	Data signal	I0, I1, I2, I3	Inputs to LUT4
Input	Control signal	Enable	Clock enable shared by all LCs in the PLB
Input	Control signal	Set/Reset[1]	Asynchronous or synchronous local set/reset shared by all LCs in the PLB.
Input	Control signal	Clock	Clock one of the eight Global Buffers, or from the general-purpose interconnects fabric shared by all LCs in the PLB
Input	Inter-PLB signal	FCIN	Fast carry in
Output	Data signals	O	LUT4 or registered output
Output	Inter-PFU signal	FCOUT	Fast carry out

[1] If Set/Reset is not used, then the flip-flop is never set/reset, except when cleared immediately after configuration.

Table 2-3. PLL Signal Descriptions

Signal Name	Direction	Description
REFERENCECLK	Input	Input reference clock
BYPASS	Input	When FEEDBACK_PATH is set to SIMPLE, the BYPASS control selects which clock signal connects to the PLLOUT output. 0 = PLL generated signal 1 = REFERENCECLK
EXTFEEDBACK	Input	External feedback input to PLL. Enabled when the FEEDBACK_PATH attribute is set to EXTERNAL.
DYNAMICDELAY[3:0]	Input	Fine delay adjustment control inputs. Enabled when DELAY_ADJUSTMENT_MODE is set to DYNAMIC.
LATCHINPUTVALUE	Input	When enabled, forces the PLL into low-power mode; PLL output is held static at the last input clock value. Set ENABLE ICEGATE_PORTA and PORTB to '1' to enable.
PLLOUTGLOBAL	Output	Output from the Phase-Locked Loop (PLL). Drives a global clock network on the FPGA. The port has optimal connections to global clock buffers GBUF4 and GBUF5.
PLLOUTCORE	Output	Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTLGOBAL port.
LOCK	Output	When High, indicates that the PLL output is phase aligned or locked to the input reference clock.
RESET	Input	Active low reset.

sysMEM Embedded Block RAM Memory

Larger iCE40 device includes multiple high-speed synchronous sysMEM Embedded Block RAMs (EBRs), each 4 kbit in size. This memory can be used for a wide variety of purposes including data buffering, and FIFO.

sysMEM Memory Block

The sysMEM block can implement single port, pseudo dual port, or FIFO memories with programmable logic resources. Each block can be used in a variety of depths and widths as shown in Table 2-4.

1. For iCE40 EBR primitives with a negative-edged Read or Write clock, the base primitive name is appended with a 'N' and a 'R' or 'W' depending on the clock that is affected.

sysIO

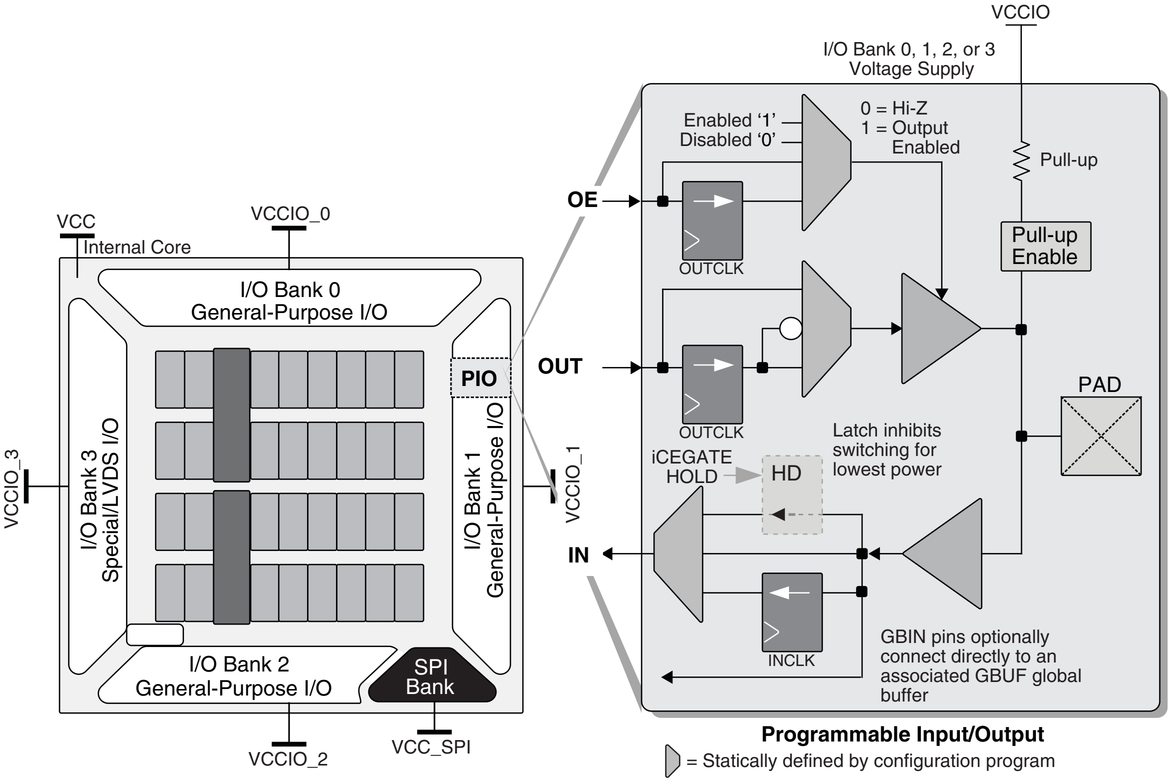
Buffer Banks

iCE40 devices have up to four I/O banks with independent V_{CCIO} rails with an additional configuration bank V_{CC_SPI} for the SPI I/Os.

Programmable I/O (PIO)

The programmable logic associated with an I/O is called a PIO. The individual PIO are connected to their respective sysIO buffers and pads. The PIOs are placed on all four sides of the device.

Figure 2-5. I/O Bank and Programmable I/O Cell



The PIO contains three blocks: an input register block, output register block iCEgate™ and tri-state register block. To save power, the optional iCEgate™ latch can selectively freeze the state of individual, non-registered inputs within an I/O bank. Note that the freeze signal is common to the bank. These blocks can operate in a variety of modes along with the necessary clock and selection logic.

Input Register Block

The input register blocks for the PIOs on all edges contain registers that can be used to condition high-speed interface signals before they are passed to the device core. In Generic DDR mode, two registers are used to sample the data on the positive and negative edges of the system clock signal, creating two data streams.

Output Register Block

The output register block can optionally register signals from the core of the device before they are passed to the sysIO buffers. In Generic DDR mode, two registers are used to capture the data on the positive and negative edge of the system clock and then muxed creating one data stream.

Figure 2-6 shows the input/output register block for the PIOs.

fers. Bank 3 additionally supports differential LVDS25 input buffers. Each sysIO bank has its own dedicated power supply.

Typical I/O Behavior During Power-up

The internal power-on-reset (POR) signal is deactivated when V_{CC}, V_{CCIO_2}, V_{PP_2V5}, and V_{CC_SPI} have reached the level defined in the Power-On-Reset Voltage table in the DC and Switching Characteristics section of this data sheet. After the POR signal is deactivated, the FPGA core logic becomes active. It is the user's responsibility to ensure that all V_{CCIO} banks are active with valid input logic levels to properly control the output logic states of all the I/O banks that are critical to the application. The default configuration of the I/O pins in a device prior to configuration is tri-stated with a weak pull-up to V_{CCIO}. The I/O pins will maintain the pre-configuration state until V_{CC} and V_{CCIO} (for I/O banks containing configuration I/Os) have reached levels, at which time the I/Os will take on the software user-configured settings only after a proper download/configuration. Unused IOs are automatically blocked and the pullup termination is disabled.

Supported Standards

The iCE40 sysIO buffer supports both single-ended and differential input standards. The single-ended standard supported is LVCMOS. The buffer supports the LVCMOS 1.8, 2.5, and 3.3 V standards. The buffer has individually configurable options for bus maintenance (weak pull-up or none). The High Current output buffer have individually configurable options for drive strength.

Table 2-7 and Table 2-8 show the I/O standards (together with their supply and reference voltages) supported by the iCE40 devices.

Table 2-7. Supported Input Standards

Input Standard	V_{CCIO} (Typical)		
	3.3 V	**2.5 V**	**1.8 V**
Single-Ended Interfaces			
LVCMOS33	Yes		
LVCMOS25		Yes	
LVCMOS18			Yes
Differential Interfaces			
LVDS25[1]		Yes	
subLVDS[1]			Yes

Table 2-8. Supported Output Standards

Output Standard	V_{CCIO} (Typical)
Single-Ended Interfaces	
LVCMOS33	3.3
LVCMOS25	2.5
LVCMOS18	1.8
Differential Interfaces	
LVDS25E[1]	2.5
subLVDSE[1]	1.8

1. These interfaces can be emulated with external resistors in all devices.

Non-Volatile Configuration Memory

All iCE40 devices provide a Non-Volatile Configuration Memory (NVCM) block which can be used to configure the device.

For more information on the NVCM, please refer to TN1248, iCE40 Programming and Configuration Usage Guide.

Power On Reset

iCE40 devices have power-on reset circuitry to monitor V_{CC}, V_{CCIO_2}, V_{PP_2V5}, and V_{CC_SPI} voltage levels during power-up and operation. At power-up, the POR circuitry monitors V_{CC}, V_{CCIO_2}, V_{PP_2V5}, and V_{CC_SPI} (controls configuration) voltage levels. It then triggers download from the on-chip NVCM or external Flash memory after reaching the power-up levels specified in the Power-On-Reset Voltage table in the DC and Switching Characteristics section of this data sheet. Before and during configuration, the I/Os are held in tri-state. I/Os are released to user functionality once the device has finished configuration.

Programming and Configuration

This section describes the programming and configuration of the iCE40 family.

Device Programming

The NVCM memory can be programmed through the SPI port.

Device Configuration

There are various ways to configure the Configuration RAM (CRAM) including:

1. Internal NVCM Download
2. From a SPI Flash (Master SPI mode)
3. System microprocessor to drive a Serial Slave SPI port (SSPI mode)

The image to configure the CRAM can be selected by the user on power up (Cold Boot) or once powered up (Warm Boot).

For more details on programming and configuration, see TN1248, iCE40 Programming and Configuration Usage Guide.

Power Saving Options

iCE40 devices are available in two options for maximum flexibility: LP and HX devices. The LP devices have ultra low static and dynamic power consumption. HX devices are designed to provide high performance. Both the LP and the HX devices operate at 1.2 V V_{CC}.

iCE40 devices feature iCEGate and PLL low power mode to allow users to meet the static and dynamic power requirements of their applications. While these features are available in both device types, these features are mainly intended for use with iCE40 LP devices to manage power consumption.

Table 2-9. iCE40 Power Saving Features Description

Device Subsystem	Feature Description
PLL	When LATCHINPUTVALUE is enabled, forces the PLL into low-power mode; PLL output held static at last input clock value.
iCEGate	To save power, the optional iCEgate latch can selectively freeze the state of individual, non-registered inputs within an I/O bank. Registered inputs are effectively frozen by their associated clock or clock-enable control.

Power Supply Ramp Rates[1, 2]

Symbol	Parameter		Min.	Max.	Units
t_{RAMP}	Power supply ramp rates for all power supplies.	All configuration modes. No power supply sequencing.	0.40	10	V/ms

LVDS25E Emulation

iCE40 devices can support LVDSE outputs via emulation on all banks. The output is emulated using complementary LVCMOS outputs in conjunction with resistors across the driver outputs on all devices. The scheme shown in Figure 3-1 is one possible solution for LVDS25E standard implementation. Resistor values in Figure 3-1 are industry standard values for 1% resistors.

Table 3-1. LVDS25E DC Conditions

Over Recommended Operating Conditions

Parameter	Description	Typ.	Units
Z_{OUT}	Output impedance	20	Ohms
R_S	Driver series resistor	150	Ohms
R_P	Driver parallel resistor	140	Ohms
R_T	Receiver termination	100	Ohms
V_{OH}	Output high voltage	1.43	V
V_{OL}	Output low voltage	1.07	V
V_{OD}	Output differential voltage	0.30	V
V_{CM}	Output common mode voltage	1.25	V
Z_{BACK}	Back impedance	100.5	Ohms
I_{DC}	DC output current	6.03	mA

Typical Building Block Function Performance – LP Devices[1, 2]

Pin-to-Pin Performance (LVCMOS25)

Function	Timing	Units
Basic Functions		
16-bit decoder	11.0	ns
4:1 MUX	12.0	ns
16:1 MUX	13.0	ns

Register-to-Register Performance

Function	Timing	Units
Basic Functions		
16:1 MUX	190	MHz
16-bit adder	160	MHz
16-bit counter	175	MHz
64-bit counter	65	MHz
Embedded Memory Functions		
256x16 Pseudo-Dual Port RAM	240	MHz

1. The above timing numbers are generated using the iCECube2 design tool. Exact performance may vary with device and tool version. The tool uses internal parameters that have been characterized but are not tested on every device.
2. Using a V_{CC} of 1.14 V at Junction Temp 85 °C.

Typical Building Block Function Performance – HX Devices[1, 2]

Pin-to-Pin Performance (LVCMOS25)

Function	Timing	Units
Basic Functions		
16-bit decoder	10.0	ns
4:1 MUX	9.0	ns
16:1 MUX	9.5	ns

Register-to-Register Performance

Function	Timing	Units
Basic Functions		
16:1 MUX	305	MHz
16-bit adder	220	MHz
16-bit counter	255	MHz
64-bit counter	105	MHz
Embedded Memory Functions		
256x16 Pseudo-Dual Port RAM	403	MHz

1. The above timing numbers are generated using the iCECube2 design tool. Exact performance may vary with device and tool version. The tool uses internal parameters that have been characterized but are not tested on every device.
2. Using a V_{CC} of 1.14 V at Junction Temp 85 °C.

Over Recommended Commercial Operating Conditions - HX Devices[1, 2, 3, 4, 5]

Buffer Type	Description	Timing	Units
Input Adjusters			
LVDS25	LVDS, V_{CCIO} = 2.5 V	0.13	ns
subLVDS	subLVDS, V_{CCIO} = 1.8 V	1.03	ns
LVCMOS33	LVCMOS, V_{CCIO} = 3.3 V	0.16	ns
LVCMOS25	LVCMOS, V_{CCIO} = 2.5 V	0.00	ns
LVCMOS18	LVCMOS, V_{CCIO} = 1.8 V	0.23	ns
Output Adjusters			
LVDS25E	LVDS, Emulated, V_{CCIO} = 2.5 V	0.00	ns
subLVDSE	subLVDS, Emulated, V_{CCIO} = 1.8 V	1.76	ns
LVCMOS33	LVCMOS, V_{CCIO} = 3.3 V	0.17	ns
LVCMOS25	LVCMOS, V_{CCIO} = 2.5 V	0.00	ns
LVCMOS18	LVCMOS, V_{CCIO} = 1.8 V	1.76	ns

1. Timing adders are relative to LVCMOS25 and characterized but not tested on every device.
2. LVCMOS timing measured with the load specified in Switching Test Condition table.
3. All other standards tested according to the appropriate specifications.
4. Commercial timing numbers are shown.
5. Not all I/O standards are supported for all banks. See the Architecture section of this data sheet for details.

Date	Version	Section	Change Summary
February 2014	02.8	Introduction	Updated Features section. — Corrected standby power units. — Included High Current LED Drivers
			Updated Table 1-1, iCE40 Family Selection Guide. — Removed LP384 Programmable I/O for 81 ucBGA package.
		Architecture	Updated Supported Standards section. Added information on High Current LED drivers.
		DC and Switching Characteristics	Corrected typos.
			Added footnote to the Peak Startup Supply Current – LP Devices table.
		Ordering Information	Updated part number description in the Ultra Low Power (LP) Devices section.
			Added part numbers to the Ultra Low Power Industrial Grade Devices, Halogen Free (RoHS) Packaging table.
October 2013	02.7	Introduction	Updated Features list and iCE40 Family Selection Guide table.
		Architecture	Revised iCE40-1K device to iCE40LP/HX1K device.
		DC and Switching Characteristics	Added iCE40LP640 device information.
		Pinout Information	Added iCE40LP640 and iCE40LP1K information.
		Ordering Information	Added iCE40LP640 and iCE40LP1K information.
September 2013	02.6	DC and Switching Characteristics	Updated Absolute Maximum Ratings section.
			Updated sysCLOCK PLL Timing – Preliminary table.
		Pinout Information	Updated Pin Information Summary table.
August 2013	02.5	Introduction	Updated the iCE40 Family Selection Guide table.
		DC and Switching Characteristics	Updated the following tables: — Absolute Maximum Ratings — Power-On-Reset Voltage Levels — Static Supply Current – LP Devices — Static Supply Current – HX Devices — Programming NVCM Supply Current – LP Devices — Programming NVCM Supply Current – HX Devices — Peak Startup Supply Current – LP Devices — sysIO Recommended Operating Conditions — Typical Building Block Function Performance – HX Devices — iCE40 External Switching Characteristics – HX Devices — sysCLOCK PLL Timing – Preliminary — SPI Master or NVCM Configuration Time
		Pinout Information	Updated the Pin Information Summary table.
July 2013	02.4	Introduction	Updated the iCE40 Family Selection Guide table.
		DC and Switching Characteristics	Updated the sysCONFIG Port Timing Specifications table.
			Updated footnote in DC Electrical Characteristics table.
			GDDR tables removed. Support to be provided in a technical note.
		Pinout Information	Updated the Pin Information Summary table.
		Ordering Information	Updated the top-side markings figure.
			Updated the Ultra Low Power Industrial Grade Devices, Halogen Free (RoHS) Packaging table.
May 2013	02.3	DC and Switching Characteristics	Added new data from Characterization.

Date	Version	Section	Change Summary
April 2013	02.2	Introduction	Added the LP8K 81 ucBGA.
		Architecture	Corrected typos.
		DC and Switching Characteristics	Corrected typos. Added 7:1 LVDS waveforms.
		Pinout Information	Corrected typos in signal descriptions. Added the LP8K 81 ucBGA.
		Ordering Information	Added the LP8K 81 ucBGA.
March 2013	02.1	DC and Switching Characteristics	Recommended operating conditions added requirement for Master SPI.
			Updated Recommended Operating Conditions for V_{PP_2V5}.
			Updated Power-On-Reset Voltage Levels and sequence requirements.
			Updated Static Supply Current conditions.
			Changed unit for t_{SKEW_IO} from ns to ps.
			Updated range of CCLK f_{MAX}.
		Ordering Information	Updated ordering information to include tape and reel part numbers.
September 2012	02.0	—	Merged SiliconBlue iCE40 LP and HX data sheets and updated to Lattice format.
	01.31	—	Updated Table 1.
	01.3	—	Production release.
			Updated notes on Table 3: Recommended Operating Conditions.
			Updated values in Table 4, Table 5, Table 12, Table 13 and Table 17.
	01.21	—	Updated Figure 3 and Figure 4 to specify iCE40.
Aug 2012	01.2	—	Updated company name.
July 2011	01.1	—	Moved package specifications to iCE40 pinout Excel files.
			Updated Table 1 maximum I/Os.
	01.01	—	Added 640, 1K and 4K to Table 13 configuration times. Updated Table 1 maximum I/Os.
	01.0	—	Initial release.
