Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Global Reset Control

The global reset control signal connects to all PLB and PIO flip-flops on the iCE40 device. The global reset signal is automatically asserted throughout the configuration process, forcing all flip-flops to their defined wake-up state. For PLB flip-flops, the wake-up state is always reset, regardless of the PLB flip-flop primitive used in the application.

sysCLOCK Phase Locked Loops (PLLs)

The sysCLOCK PLLs provide the ability to synthesize clock frequencies. The iCE40 devices have one or more sysCLOCK PLLs. REFERENCECLK is the reference frequency input to the PLL and its source can come from an external I/O pin or from internal routing. EXTFEEDBACK is the feedback signal to the PLL which can come from internal routing or an external I/O pin. The feedback divider is used to multiply the reference frequency and thus synthesize a higher frequency clock output.

The PLLOUT output has an output divider, thus allowing the PLL to generate different frequencies for each output. The output divider can have a value from 1 to 6. The PLLOUT outputs can all be used to drive the iCE40 global clock network directly or general purpose routing resources can be used.

The LOCK signal is asserted when the PLL determines it has achieved lock and de-asserted if a loss of lock is detected. A block diagram of the PLL is shown in Figure 2-3.

The timing of the device registers can be optimized by programming a phase shift into the PLLOUT output clock which will advance or delay the output clock with reference to the REFERENCECLK clock. This phase shift can be either programmed during configuration or can be adjusted dynamically. In dynamic mode, the PLL may lose lock after a phase adjustment on the output used as the feedback source and not relock until the t_{LOCK} parameter has been satisfied.

For more details on the PLL, see TN1251, [iCE40 sysCLOCK PLL Design and Usage Guide](#).

Figure 2-3. PLL Diagram

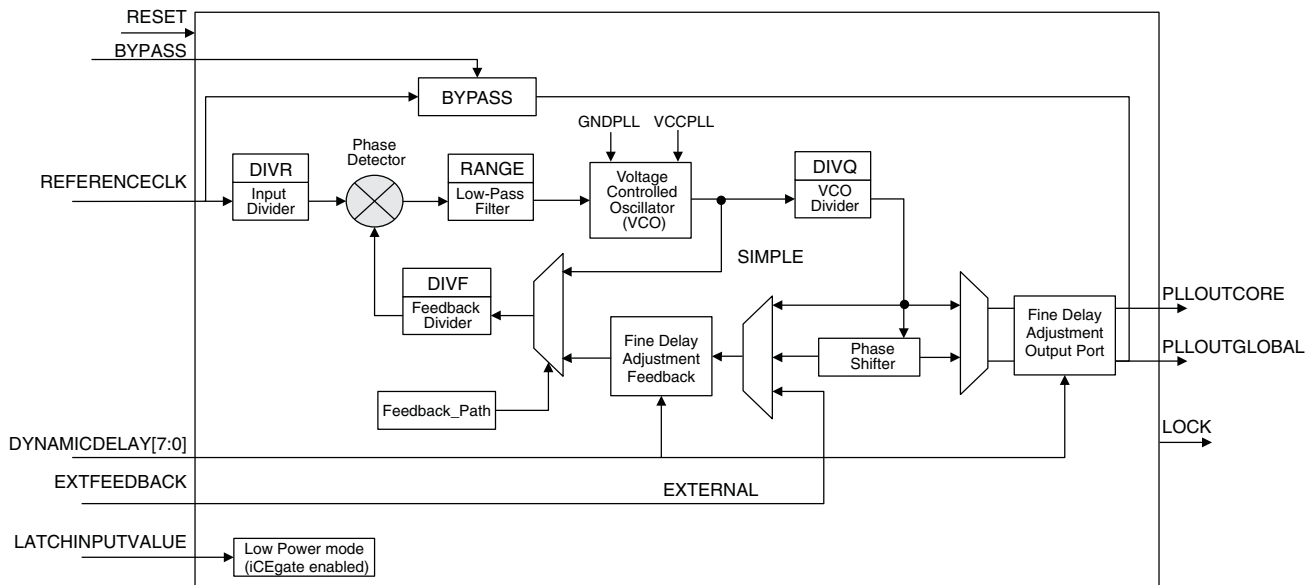

Table 2-3 provides signal descriptions of the PLL block.

Table 2-3. PLL Signal Descriptions

| Signal Name | Direction | Description |
|-------------------|-----------|---|
| REFERENCECLK | Input | Input reference clock |
| BYPASS | Input | When FEEDBACK_PATH is set to SIMPLE, the BYPASS control selects which clock signal connects to the PLLOUT output. 0 = PLL generated signal 1 = REFERENCECLK |
| EXTFEEDBACK | Input | External feedback input to PLL. Enabled when the FEEDBACK_PATH attribute is set to EXTERNAL. |
| DYNAMICDELAY[3:0] | Input | Fine delay adjustment control inputs. Enabled when DELAY_ADJUSTMENT_MODE is set to DYNAMIC. |
| LATCHINPUTVALUE | Input | When enabled, forces the PLL into low-power mode; PLL output is held static at the last input clock value. Set ENABLE ICEGATE_PORTA and PORTB to '1' to enable. |
| PLLOUTGLOBAL | Output | Output from the Phase-Locked Loop (PLL). Drives a global clock network on the FPGA. The port has optimal connections to global clock buffers GBUF4 and GBUF5. |
| PLLOUTCORE | Output | Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTGLOBAL port. |
| LOCK | Output | When High, indicates that the PLL output is phase aligned or locked to the input reference clock. |
| RESET | Input | Active low reset. |

sysMEM Embedded Block RAM Memory

Larger iCE40 device includes multiple high-speed synchronous sysMEM Embedded Block RAMs (EBRs), each 4 kbit in size. This memory can be used for a wide variety of purposes including data buffering, and FIFO.

sysMEM Memory Block

The sysMEM block can implement single port, pseudo dual port, or FIFO memories with programmable logic resources. Each block can be used in a variety of depths and widths as shown in Table 2-4.

Table 2-4. sysMEM Block Configurations¹

1. For iCE40 EBR primitives with a negative-edged Read or Write clock, the base primitive name is appended with a 'N' and a 'R' or 'W' depending on the clock that is affected.

RAM Initialization and ROM Operation

If desired, the contents of the RAM can be pre-loaded during device configuration.

By preloading the RAM block during the chip configuration cycle and disabling the write controls, the sysMEM block can also be utilized as a ROM.

Note the sysMEM Embedded Block RAM Memory address 0 cannot be initialized.

Memory Cascading

Larger and deeper blocks of RAM can be created using multiple EBR sysMEM Blocks.

RAM4k Block

Figure 2-4 shows the 256x16 memory configurations and their input/output names. In all the sysMEM RAM modes, the input data and addresses for the ports are registered at the input of the memory array.

fers. Bank 3 additionally supports differential LVDS25 input buffers. Each sysIO bank has its own dedicated power supply.

Typical I/O Behavior During Power-up

The internal power-on-reset (POR) signal is deactivated when V_{CC} , V_{CCIO_2} , V_{PP_2V5} , and V_{CC_SPI} have reached the level defined in the Power-On-Reset Voltage table in the DC and Switching Characteristics section of this data sheet. After the POR signal is deactivated, the FPGA core logic becomes active. It is the user’s responsibility to ensure that all V_{CCIO} banks are active with valid input logic levels to properly control the output logic states of all the I/O banks that are critical to the application. The default configuration of the I/O pins in a device prior to configuration is tri-stated with a weak pull-up to V_{CCIO} . The I/O pins will maintain the pre-configuration state until V_{CC} and V_{CCIO} (for I/O banks containing configuration I/Os) have reached levels, at which time the I/Os will take on the software user-configured settings only after a proper download/configuration. Unused IOs are automatically blocked and the pullup termination is disabled.

Supported Standards

The iCE40 sysIO buffer supports both single-ended and differential input standards. The single-ended standard supported is LVCMOS. The buffer supports the LVCMOS 1.8, 2.5, and 3.3 V standards. The buffer has individually configurable options for bus maintenance (weak pull-up or none). The High Current output buffer have individually configurable options for drive strength.

Table 2-7 and Table 2-8 show the I/O standards (together with their supply and reference voltages) supported by the iCE40 devices.

Table 2-7. Supported Input Standards

| Input Standard | V_{CCIO} (Typical) | | |

1. These interfaces can be emulated with external resistors in all devices.

Non-Volatile Configuration Memory

All iCE40 devices provide a Non-Volatile Configuration Memory (NVCM) block which can be used to configure the device.

For more information on the NVCM, please refer to TN1248, [iCE40 Programming and Configuration Usage Guide](#).

Power On Reset

iCE40 devices have power-on reset circuitry to monitor V_{CC} , V_{CCIO_2} , V_{PP_2V5} , and V_{CC_SPI} voltage levels during power-up and operation. At power-up, the POR circuitry monitors V_{CC} , V_{CCIO_2} , V_{PP_2V5} , and V_{CC_SPI} (controls configuration) voltage levels. It then triggers download from the on-chip NVCM or external Flash memory after reaching the power-up levels specified in the Power-On-Reset Voltage table in the DC and Switching Characteristics section of this data sheet. Before and during configuration, the I/Os are held in tri-state. I/Os are released to user functionality once the device has finished configuration.

Programming and Configuration

This section describes the programming and configuration of the iCE40 family.

Device Programming

The NVCM memory can be programmed through the SPI port.

Device Configuration

There are various ways to configure the Configuration RAM (CRAM) including:

1. Internal NVCM Download
2. From a SPI Flash (Master SPI mode)
3. System microprocessor to drive a Serial Slave SPI port (SSPI mode)

The image to configure the CRAM can be selected by the user on power up (Cold Boot) or once powered up (Warm Boot).

For more details on programming and configuration, see TN1248, [iCE40 Programming and Configuration Usage Guide](#).

Power Saving Options

iCE40 devices are available in two options for maximum flexibility: LP and HX devices. The LP devices have ultra low static and dynamic power consumption. HX devices are designed to provide high performance. Both the LP and the HX devices operate at 1.2 V V_{CC} .

iCE40 devices feature iCEGate and PLL low power mode to allow users to meet the static and dynamic power requirements of their applications. While these features are available in both device types, these features are mainly intended for use with iCE40 LP devices to manage power consumption.

Table 2-9. iCE40 Power Saving Features Description

| Device Subsystem | Feature Description |
|------------------|---|
| PLL | When LATCHINPUTVALUE is enabled, forces the PLL into low-power mode; PLL output held static at last input clock value. |
| iCEGate | To save power, the optional iCEgate latch can selectively freeze the state of individual, non-registered inputs within an I/O bank. Registered inputs are effectively frozen by their associated clock or clock-enable control. |

Power Supply Ramp Rates^{1, 2}

| Symbol | Parameter | Min. | Max. | Units | |
|-------------------|---|---|------|-------|------|
| t_{RAMP} | Power supply ramp rates for all power supplies. | All configuration modes. No power supply sequencing. | 0.40 | 10 | V/ms |
| | | Configuring from Slave SPI. No power supply sequencing. | 0.01 | 10 | V/ms |
| | | Configuring from NVCM. V_{CC} and $V_{\text{PP_2V5}}$ to be powered 0.25 ms before $V_{\text{CC_SPI}}$. | 0.01 | 10 | V/ms |
| | | Configuring from MSPI. V_{CC} and $V_{\text{PP_SPI}}$ to be powered 0.25 ms before $V_{\text{PP_2V5}}$. | 0.01 | 10 | V/ms |

- Assumes monotonic ramp rates.
- iCE40LP384 requires V_{CC} to be greater than 0.7V when V_{CCIO} and $V_{\text{CC_SPI}}$ are above GND.

- Assumes all inputs are held at V_{CCIO} or GND and all outputs are tri-stated.
- Typical user pattern.
- SPI programming is at 8 MHz.
- $T_J = 25^\circ C$, power supplies at nominal voltage.
- Per bank. $V_{CCIO} = 2.5 V$. Does not include pull-up.
- No PLL available on the iCE40-LP384 and iCE40-LP640 device.
- V_{CCPLL} is tied to V_{CC} internally in packages without PLLs pins.
- V_{PP_FAST} , used only for fast production programming, must be left floating or unconnected in applications, except CM36 and CM49 packages MUST have the V_{PP_FAST} ball connected to V_{CCIO_0} ball externally.

sysIO Differential Electrical Characteristics

The LVDS25E/subLVDSSE differential output buffers are available on all banks but the LVDS/subLVDS input buffers are only available on Bank 3 of iCE40 devices.

1. Period jitter sample is taken over 10,000 samples of the primary PLL output with a clean reference clock. Cycle-to-cycle jitter is taken over 1000 cycles. Phase jitter is taken over 2000 cycles. All values per JESD65B.
2. Output clock is valid after t_{LOCK} for PLL reset and dynamic delay adjustment.
3. At minimum f_{PFD} . As the f_{PFD} increases the time will decrease to approximately 60% the value listed.
4. Maximum limit to prevent PLL unlock from occurring. Does not imply the PLL will operate within the output specifications listed in this table.
5. The jitter values will increase with loading of the PLD fabric and in the presence of SSO noise.

1. Assumes sysMEM Block is initialized to an all zero pattern if they are used.

2. The NVCM download time is measured with a fast ramp rate starting from the maximum voltage of POR trip point.

1. Does not apply for NVCM.

2. Supported only with 1.2 V V_{CC} and at 25 °C.

3. Extended range f_{MAX} Write operations support up to 53 MHz only with 1.2 V V_{CC} and at 25 °C.

Signal Descriptions

| Signal Name | I/O | Descriptions |
|--|-----|--|
| General Purpose | | |
| IO[Bank]_[Row/Column Number][A/B] | I/O | [Bank] indicates the bank of the device on which the pad is located. [Number] indicates IO number on the device. |
| IO[Bank]_[Row/Column Number][A/B] | I/O | [Bank] indicates the bank of the device on which the pad is located. [Number] indicates IO number on the device. [A/B] indicates the differential I/O. 'A' = negative input. 'B' = positive input. |
| HCIO[Bank]_[Number] | I/O | High Current IO. [Bank] indicates the bank of the device on which the pad is located. [Number] indicates IO number. |
| NC | — | No connect |
| GND | — | GND – Ground. Dedicated pins. It is recommended that all GNDs are tied together. |
| VCC | — | VCC – The power supply pins for core logic. Dedicated pins. It is recommended that all VCCs are tied to the same supply. |
| VCCIO_x | — | VCCIO – The power supply pins for I/O Bank x. Dedicated pins. All VCCIOs located in the same bank are tied to the same supply. |
| PLL and Global Functions (Used as user-programmable I/O pins when not used for PLL or clock pins) | | |
| VCCPLLx | — | PLL VCC – Power. Dedicated pins. The PLL requires a separate power and ground that is quiet and stable to reduce the output clock jitter of the PLL. |
| GNDPLLx | — | PLL GND – Ground. Dedicated pins. The sysCLOCK PLL has the DC ground connection made on the FPGA, so the external PLL ground connection (GNDPLL) must NOT be connected to the board's ground. |
| GBINx | — | Global pads. Two per side. |
| Programming and Configuration | | |
| CBSEL[0:1] | I/O | Dual function pins. I/Os when not used as CBSEL. Optional ColdBoot configuration SElect input, if ColdBoot mode is enabled. |
| CRESET_B | I | Configuration Reset, active Low. Dedicated input. No internal pull-up resistor. Either actively drive externally or connect a 10 KOhm pull-up resistor to VCCIO_2. |
| CDONE | I/O | Configuration Done. Includes a permanent weak pull-up resistor to VCCIO_2. If driving external devices with CDONE output, an external pull-up resistor to VCCIO_2 may be required. Refer to the TN1248, iCE40 Programming and Configuration for more details. Following device configuration the iCE40LP640 and iCE40LP1K in the SWG16 package CDONE pin can be used as a user output. |
| VCC_SPI | — | SPI interface voltage supply input. Must have a valid voltage even if configuring from NVCM. |
| SPI_SCK | I/O | Input Configuration Clock for configuring an FPGA in Slave SPI mode. Output Configuration Clock for configuring an FPGA configuration modes. |
| SPI_SS_B | I/O | SPI Slave Select. Active Low. Includes an internal weak pull-up resistor to VCC_SPI during configuration. During configuration, the logic level sampled on this pin determines the configuration mode used by the iCE40 device. An input when sampled at the start of configuration. An input when in SPI Peripheral configuration mode (SPI_SS_B = Low). An output when in Master SPI Flash configuration mode. |
| SPI_SI | I/O | Slave SPI serial data input and master SPI serial data output |
| SPI_SO | I/O | Slave SPI serial data output and master SPI serial data input |

| Date | Version | Section | Change Summary |
|----------------------|--|----------------------------------|---|
| February 2014 | 02.8 | Introduction | Updated Features section. — Corrected standby power units. — Included High Current LED Drivers |
| | | | Updated Table 1-1, iCE40 Family Selection Guide. — Removed LP384 Programmable I/O for 81 ucBGA package. |
| | | Architecture | Updated Supported Standards section. Added information on High Current LED drivers. |
| | | DC and Switching Characteristics | Corrected typos. |
| | | | Added footnote to the Peak Startup Supply Current – LP Devices table. |
| Ordering Information | Updated part number description in the Ultra Low Power (LP) Devices section. | | |
| | Added part numbers to the Ultra Low Power Industrial Grade Devices, Halogen Free (RoHS) Packaging table. | | |
| October 2013 | 02.7 | Introduction | Updated Features list and iCE40 Family Selection Guide table. |
| | | Architecture | Revised iCE40-1K device to iCE40LP/HX1K device. |
| | | DC and Switching Characteristics | Added iCE40LP640 device information. |
| | | Pinout Information | Added iCE40LP640 and iCE40LP1K information. |
| | | Ordering Information | Added iCE40LP640 and iCE40LP1K information. |
| September 2013 | 02.6 | DC and Switching Characteristics | Updated Absolute Maximum Ratings section. |
| | | | Updated sysCLOCK PLL Timing – Preliminary table. |
| | | Pinout Information | Updated Pin Information Summary table. |
| August 2013 | 02.5 | Introduction | Updated the iCE40 Family Selection Guide table. |
| | | DC and Switching Characteristics | Updated the following tables: — Absolute Maximum Ratings — Power-On-Reset Voltage Levels — Static Supply Current – LP Devices — Static Supply Current – HX Devices — Programming NVCM Supply Current – LP Devices — Programming NVCM Supply Current – HX Devices — Peak Startup Supply Current – LP Devices — sysIO Recommended Operating Conditions — Typical Building Block Function Performance – HX Devices — iCE40 External Switching Characteristics – HX Devices — sysCLOCK PLL Timing – Preliminary — SPI Master or NVCM Configuration Time |
| | | | Pinout Information |
| July 2013 | 02.4 | Introduction | Updated the iCE40 Family Selection Guide table. |
| | | DC and Switching Characteristics | Updated the sysCONFIG Port Timing Specifications table. |
| | | | Updated footnote in DC Electrical Characteristics table. |
| | | | GDDR tables removed. Support to be provided in a technical note. |
| | | Pinout Information | Updated the Pin Information Summary table. |
| Ordering Information | Updated the top-side markings figure. | | |
| | Updated the Ultra Low Power Industrial Grade Devices, Halogen Free (RoHS) Packaging table. | | |
| May 2013 | 02.3 | DC and Switching Characteristics | Added new data from Characterization. |
