Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Features

- **Flexible Logic Architecture**
 - Five devices with 384 to 7,680 LUT4s and 10 to 206 I/Os
- **Ultra Low Power Devices**
 - Advanced 40 nm low power process
 - As low as 21 μ A standby power
 - Programmable low swing differential I/Os
- **Embedded and Distributed Memory**
 - Up to 128 kbits sysMEM™ Embedded Block RAM
- **Pre-Engineered Source Synchronous I/O**
 - DDR registers in I/O cells
- **High Current LED Drivers**
 - Three High Current Drivers used for three different LEDs or one RGB LED
- **High Performance, Flexible I/O Buffer**
 - Programmable sysIO™ buffer supports wide range of interfaces:
 - LVCMOS 3.3/2.5/1.8
 - LVDS25E, subLVDS
 - Schmitt trigger inputs, to 200 mV typical hysteresis
 - Programmable pull-up mode
- **Flexible On-Chip Clocking**
 - Eight low-skew global clock resources
 - Up to two analog PLLs per device
- **Flexible Device Configuration**
 - SRAM is configured through:
 - Standard SPI Interface
 - Internal Nonvolatile Configuration Memory (NVCN)
- **Broad Range of Package Options**
 - WLCSP, QFN, VQFP, TQFP, ucBGA, caBGA, and csBGA package options
 - Small footprint package options
 - As small as 1.40 mm x 1.48 mm
 - Advanced halogen-free packaging

3. High Current I/Os only available on the 16 WLCSP package.

Introduction

The iCE40 family of ultra-low power, non-volatile FPGAs has five devices with densities ranging from 384 to 7680 Look-Up Tables (LUTs). In addition to LUT-based, low-cost programmable logic, these devices feature Embedded Block RAM (EBR), Non-volatile Configuration Memory (NVCM) and Phase Locked Loops (PLLs). These features allow the devices to be used in low-cost, high-volume consumer and system applications. Select packages offer High-Current drivers that are ideal to drive three white LEDs, or one RGB LED.

The iCE40 devices are fabricated on a 40 nm CMOS low power process. The device architecture has several features such as programmable low-swing differential I/Os and the ability to turn off on-chip PLLs dynamically. These features help manage static and dynamic power consumption, resulting in low static power for all members of the family. The iCE40 devices are available in two versions – ultra low power (LP) and high performance (HX) devices.

The iCE40 FPGAs are available in a broad range of advanced halogen-free packages ranging from the space saving 1.40x1.48 mm WLCSP to the PCB-friendly 20x20 mm TQFP. Table 1-1 shows the LUT densities, package and I/O options, along with other key parameters.

The iCE40 devices offer enhanced I/O features such as pull-up resistors. Pull-up features are controllable on a “per-pin” basis.

The iCE40 devices also provide flexible, reliable and secure configuration from on-chip NVCM. These devices can also configure themselves from external SPI Flash or be configured by an external master such as a CPU.

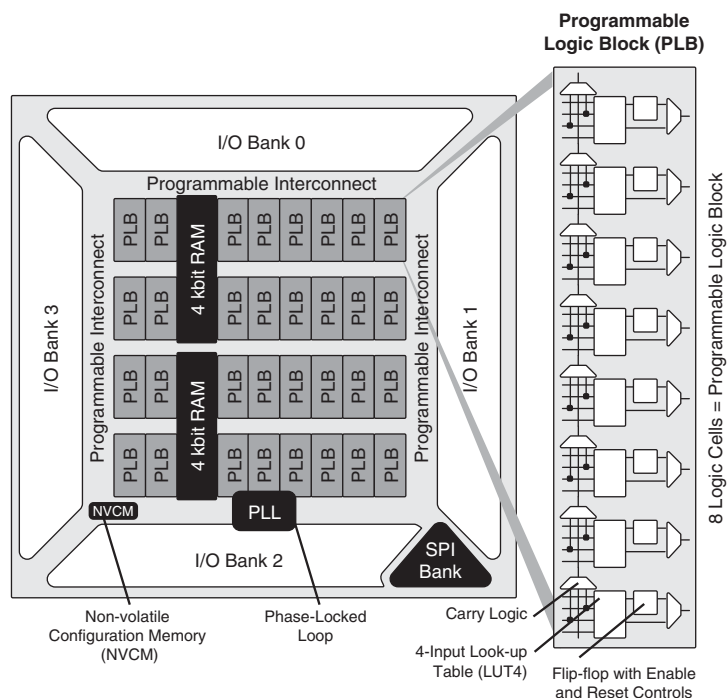

Lattice provides a variety of design tools that allow complex designs to be efficiently implemented using the iCE40 family of devices. Popular logic synthesis tools provide synthesis library support for iCE40. Lattice design tools use the synthesis tool output along with the user-specified preferences and constraints to place and route the design in the iCE40 device. These tools extract the timing from the routing and back-annotate it into the design for timing verification.

Lattice provides many pre-engineered IP (Intellectual Property) modules, including a number of reference designs, licensed free of charge, optimized for the iCE40 FPGA family. By using these configurable soft core IP cores as standardized blocks, users are free to concentrate on the unique aspects of their design, increasing their productivity.

Architecture Overview

The iCE40 family architecture contains an array of Programmable Logic Blocks (PLB), sysCLOCK™ PLLs, Non-volatile Programmable Configuration Memory (NVCM) and blocks of sysMEM™ Embedded Block RAM (EBR) surrounded by Programmable I/O (PIO). Figure 2-1 shows the block diagram of the iCE40LP/HX1K device.

Figure 2-1. iCE40LP/HX1K Device, Top View

The logic blocks, Programmable Logic Blocks (PLB) and sysMEM EBR blocks, are arranged in a two-dimensional grid with rows and columns. Each column has either logic blocks or EBR blocks. The PIO cells are located at the periphery of the device, arranged in banks. The PLB contains the building blocks for logic, arithmetic, and register functions. The PIOs utilize a flexible I/O buffer referred to as a sysIO buffer that supports operation with a variety of interface standards. The blocks are connected with many vertical and horizontal routing channel resources. The place and route software tool automatically allocates these routing resources.

In the iCE40 family, there are up to four independent sysIO banks. Note on some packages V_{CCIO} banks are tied together. There are different types of I/O buffers on the different banks. Refer to the details in later sections of this document. The sysMEM EBRs are large 4 kbit, dedicated fast memory blocks. These blocks can be configured as RAM, ROM or FIFO.

The iCE40 architecture also provides up to two sysCLOCK Phase Locked Loop (PLL) blocks. The PLLs have multiply, divide, and phase shifting capabilities that are used to manage the frequency and phase relationships of the clocks.

Every device in the family has a SPI port that supports programming and configuration of the device. The iCE40 includes on-chip, Nonvolatile Configuration Memory (NVCM).

Routing

There are many resources provided in the iCE40 devices to route signals individually with related control signals. The routing resources consist of switching circuitry, buffers and metal interconnect (routing) segments.

The inter-PLB connections are made with three different types of routing resources: Adjacent (spans two PLBs), x4 (spans five PLBs) and x12 (spans thirteen PLBs). The Adjacent, x4 and x12 connections provide fast and efficient connections in the diagonal, horizontal and vertical directions.

The design tool takes the output of the synthesis tool and places and routes the design.

Clock/Control Distribution Network

Each iCE40 device has eight global inputs, two pins on each side of the device. Note that not all GBINs are available in all packages.

These global inputs can be used as high fanout nets, clock, reset or enable signals. The dedicated global pins are identified as GBIN[7:0] and the global buffers are identified as-GBUF[7:0]. These eight inputs may be used as general purpose I/O if they are not used to drive the clock nets. Global buffer GBUF7 in I/O Bank 3 also provides an optional direct LVDS25 or subLVDS differential clock input.

Table 2-2 lists the connections between a specific global buffer and the inputs on a PLB. All global buffers optionally connect to the PLB CLK input. Any four of the eight global buffers can drive logic inputs to a PLB. Even-numbered global buffers optionally drive the Set/Reset input to a PLB. Similarly, odd-numbered buffers optionally drive the PLB clock-enable input.

Table 2-2. Global Buffer (GBUF) Connections to Programmable Logic Blocks

Global Buffer	LUT Inputs	Clock	Reset	Clock Enable
GBUF0	Yes, any 4 of 8 GBUF Inputs	Yes	Yes	
GBUF1		Yes		Yes
GBUF2		Yes	Yes	
GBUF3		Yes		Yes
GBUF4		Yes	Yes	
GBUF5		Yes		Yes
GBUF6		Yes	Yes	
GBUF7		Yes		Yes

The maximum frequency for the global buffers are shown in the iCE40 External Switching Characteristics tables later in this document.

Global Hi-Z Control

The global high-impedance control signal, GHIZ, connects to all I/O pins on the iCE40 device. This GHIZ signal is automatically asserted throughout the configuration process, forcing all user I/O pins into their high-impedance state.

Table 2-3. PLL Signal Descriptions

Signal Name	Direction	Description
REFERENCECLK	Input	Input reference clock
BYPASS	Input	When FEEDBACK_PATH is set to SIMPLE, the BYPASS control selects which clock signal connects to the PLLOUT output. 0 = PLL generated signal 1 = REFERENCECLK
EXTFEEDBACK	Input	External feedback input to PLL. Enabled when the FEEDBACK_PATH attribute is set to EXTERNAL.
DYNAMICDELAY[3:0]	Input	Fine delay adjustment control inputs. Enabled when DELAY_ADJUSTMENT_MODE is set to DYNAMIC.
LATCHINPUTVALUE	Input	When enabled, forces the PLL into low-power mode; PLL output is held static at the last input clock value. Set ENABLE ICEGATE_PORTA and PORTB to '1' to enable.
PLLOUTGLOBAL	Output	Output from the Phase-Locked Loop (PLL). Drives a global clock network on the FPGA. The port has optimal connections to global clock buffers GBUF4 and GBUF5.
PLLOUTCORE	Output	Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTGLOBAL port.
LOCK	Output	When High, indicates that the PLL output is phase aligned or locked to the input reference clock.
RESET	Input	Active low reset.

sysMEM Embedded Block RAM Memory

Larger iCE40 device includes multiple high-speed synchronous sysMEM Embedded Block RAMs (EBRs), each 4 kbit in size. This memory can be used for a wide variety of purposes including data buffering, and FIFO.

sysMEM Memory Block

The sysMEM block can implement single port, pseudo dual port, or FIFO memories with programmable logic resources. Each block can be used in a variety of depths and widths as shown in Table 2-4.

1. For iCE40 EBR primitives with a negative-edged Read or Write clock, the base primitive name is appended with a 'N' and a 'R' or 'W' depending on the clock that is affected.

sysIO

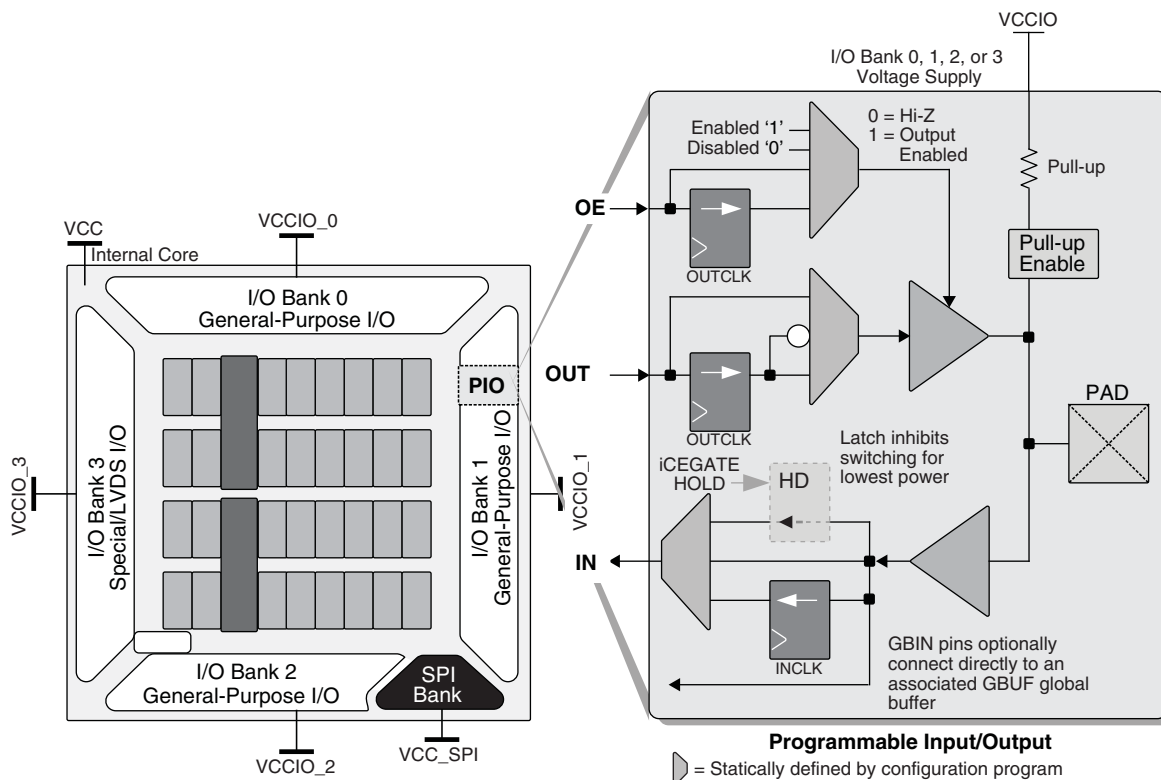

Buffer Banks

iCE40 devices have up to four I/O banks with independent V_{CCIO} rails with an additional configuration bank V_{CC_SPI} for the SPI I/Os.

Programmable I/O (PIO)

The programmable logic associated with an I/O is called a PIO. The individual PIO are connected to their respective sysIO buffers and pads. The PIOs are placed on all four sides of the device.

Figure 2-5. I/O Bank and Programmable I/O Cell

The PIO contains three blocks: an input register block, output register block iCEgate™ and tri-state register block. To save power, the optional iCEgate™ latch can selectively freeze the state of individual, non-registered inputs within an I/O bank. Note that the freeze signal is common to the bank. These blocks can operate in a variety of modes along with the necessary clock and selection logic.

Input Register Block

The input register blocks for the PIOs on all edges contain registers that can be used to condition high-speed interface signals before they are passed to the device core. In Generic DDR mode, two registers are used to sample the data on the positive and negative edges of the system clock signal, creating two data streams.

Output Register Block

The output register block can optionally register signals from the core of the device before they are passed to the sysIO buffers. In Generic DDR mode, two registers are used to capture the data on the positive and negative edge of the system clock and then muxed creating one data stream.

Figure 2-6 shows the input/output register block for the PIOs.

Absolute Maximum Ratings^{1, 2, 3, 4}

iCE40 LP/HX

Supply Voltage V_{CC}	–0.5 V to 1.42 V
Output Supply Voltage V_{CCIO} , V_{CC_SPI}	–0.5 V to 3.60 V
NVCM Supply Voltage V_{PP_2V5}	–0.5 V to 3.60 V
PLL Supply Voltage V_{CCPLL}	–0.5 V to 1.30 V
I/O Tri-state Voltage Applied	–0.5 V to 3.60 V
Dedicated Input Voltage Applied	–0.5 V to 3.60 V
Storage Temperature (Ambient)	–65 °C to 150 °C
Junction Temperature (T_J)	–55 °C to 125 °C

- Stress above those listed under the “Absolute Maximum Ratings” may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.
- Compliance with the Lattice [Thermal Management](#) document is required.
- All voltages referenced to GND.
- IOs can support a 200 mV Overshoot above the Recommend Operating Conditions V_{CCIO} (Max) and -200mV Undershoot below V_{IL} (Min). Overshoot and Undershoot is permitted for 25% duty cycle but must not exceed 1.6 ns.

Recommended Operating Conditions¹

Symbol	Parameter		Min.	Max.	Units

t _{JIND}	Junction Temperature Industrial Operation		−40	100	°C
t _{PROG}	Junction Temperature NVCM Programming		10	30	°C

- Like power supplies must be tied together. For example, if V_{CCIO} and V_{CC_SPI} are both the same voltage, they must also be the same supply.
- See recommended voltages by I/O standard in subsequent table.
- V_{CCIO} pins of unused I/O banks should be connected to the V_{CC} power supply on boards.
- V_{PP_FAST} , used only for fast production programming, must be left floating or unconnected in applications, except CM36 and CM49 packages MUST have the V_{PP_FAST} ball connected to V_{CCIO0} ball externally.
- No PLL available on the iCE40LP384 and iCE40LP640 device.
- V_{CCPLL} is tied to V_{CC} internally in packages without PLLs pins.

Power Supply Ramp Rates^{1, 2}

Symbol	Parameter		Min.	Max.	Units
t_{RAMP}	Power supply ramp rates for all power supplies.	All configuration modes. No power supply sequencing.	0.40	10	V/ms
		Configuring from Slave SPI. No power supply sequencing.	0.01	10	V/ms
		Configuring from NVCM. V_{CC} and V_{PP_2V5} to be powered 0.25 ms before V_{CC_SPI} .	0.01	10	V/ms
		Configuring from MSPI. V_{CC} and V_{PP_SPI} to be powered 0.25 ms before V_{PP_2V5} .	0.01	10	V/ms

1. Assumes monotonic ramp rates.

2. iCE40LP384 requires V_{CC} to be greater than 0.7V when V_{CCIO} and V_{CC_SPI} are above GND.

1. Input or I/O leakage current is measured with the pin configured as an input or as an I/O with the output driver tri-stated. It is not measured with the output driver active. Internal pull-up resistors are disabled.
2. $T_J = 25^\circ C$, $f = 1.0 \text{ MHz}$.
3. Please refer to V_{IL} and V_{IH} in the sysIO Single-Ended DC Electrical Characteristics table of this document.
4. Only applies to IOs in the SPI bank following configuration.
5. Some products are clamped to a diode when V_{IN} is larger than V_{CCIO} .
6. High current IOs has three sysIO buffers connected together.
7. The iCE40LP640 and iCE40LP1K SWG16 package has CDONE and a sysIO buffer are connected together.

LVC MOS18	LVC MOS, $V_{CCIO} = 1.8\text{ V}$	1.32	ns

1. Timing adders are relative to LVC MOS25 and characterized but not tested on every device.

2. LVC MOS timing measured with the load specified in Switching Test Condition table.

3. All other standards tested according to the appropriate specifications.

4. Commercial timing numbers are shown.

5. Not all I/O standards are supported for all banks. See the Architecture section of this data sheet for details.

$t_{PDBYPASS}$	Propagation delay with the PLL in bypass mode	iCE40LP	1.18	4.68	ns
		iCE40HX	1.73	4.07	ns

1. Period jitter sample is taken over 10,000 samples of the primary PLL output with a clean reference clock. Cycle-to-cycle jitter is taken over 1000 cycles. Phase jitter is taken over 2000 cycles. All values per JESD65B.
2. Output clock is valid after t_{LOCK} for PLL reset and dynamic delay adjustment.
3. At minimum f_{PFD} . As the f_{PFD} increases the time will decrease to approximately 60% the value listed.
4. Maximum limit to prevent PLL unlock from occurring. Does not imply the PLL will operate within the output specifications listed in this table.
5. The jitter values will increase with loading of the PLD fabric and in the presence of SSO noise.

Signal Descriptions

Signal Name	I/O	Descriptions
General Purpose		
IO[Bank]_[Row/Column Number][A/B]	I/O	[Bank] indicates the bank of the device on which the pad is located. [Number] indicates IO number on the device.
IO[Bank]_[Row/Column Number][A/B]	I/O	[Bank] indicates the bank of the device on which the pad is located. [Number] indicates IO number on the device. [A/B] indicates the differential I/O. 'A' = negative input. 'B' = positive input.
HCIO[Bank]_[Number]	I/O	High Current IO. [Bank] indicates the bank of the device on which the pad is located. [Number] indicates IO number.
NC	—	No connect
GND	—	GND – Ground. Dedicated pins. It is recommended that all GNDs are tied together.
VCC	—	VCC – The power supply pins for core logic. Dedicated pins. It is recommended that all VCCs are tied to the same supply.
VCCIO_x	—	VCCIO – The power supply pins for I/O Bank x. Dedicated pins. All VCCIOs located in the same bank are tied to the same supply.
PLL and Global Functions (Used as user-programmable I/O pins when not used for PLL or clock pins)		
VCCPLLx	—	PLL VCC – Power. Dedicated pins. The PLL requires a separate power and ground that is quiet and stable to reduce the output clock jitter of the PLL.
GNDPLLx	—	PLL GND – Ground. Dedicated pins. The sysCLOCK PLL has the DC ground connection made on the FPGA, so the external PLL ground connection (GNDPLL) must NOT be connected to the board's ground.
GBINx	—	Global pads. Two per side.
Programming and Configuration		
CBSEL[0:1]	I/O	Dual function pins. I/Os when not used as CBSEL. Optional ColdBoot configuration SElect input, if ColdBoot mode is enabled.
CRESET_B	I	Configuration Reset, active Low. Dedicated input. No internal pull-up resistor. Either actively drive externally or connect a 10 KOhm pull-up resistor to VCCIO_2.
CDONE	I/O	Configuration Done. Includes a permanent weak pull-up resistor to VCCIO_2. If driving external devices with CDONE output, an external pull-up resistor to VCCIO_2 may be required. Refer to the TN1248, iCE40 Programming and Configuration for more details. Following device configuration the iCE40LP640 and iCE40LP1K in the SWG16 package CDONE pin can be used as a user output.
VCC_SPI	—	SPI interface voltage supply input. Must have a valid voltage even if configuring from NVCM.
SPI_SCK	I/O	Input Configuration Clock for configuring an FPGA in Slave SPI mode. Output Configuration Clock for configuring an FPGA configuration modes.
SPI_SS_B	I/O	SPI Slave Select. Active Low. Includes an internal weak pull-up resistor to VCC_SPI during configuration. During configuration, the logic level sampled on this pin determines the configuration mode used by the iCE40 device. An input when sampled at the start of configuration. An input when in SPI Peripheral configuration mode (SPI_SS_B = Low). An output when in Master SPI Flash configuration mode.
SPI_SI	I/O	Slave SPI serial data input and master SPI serial data output
SPI_SO	I/O	Slave SPI serial data output and master SPI serial data input

iCE40 LP/HX Family Data Sheet

Revision History

March 2017

Data Sheet DS1040

Date	Version	Section	Change Summary
March 2017	3.3	Introduction	Updated Features section. Added 121-ball caBGA package for ICE40 HX4K/8K to Table 1-1, iCE40 Family Selection Guide.
		Architecture	Updated PLB Blocks section. Changed “subtractors” to “subtractions” in the Carry Logic description.
			Updated Clock/Control Distribution Network section. Switched the “Clock Enable” and the “Reset” headings in Table 2-2, Global Buffer (GBUF) Connections to Programmable Logic Blocks.
		Pinout Information	Updated Pin Information Summary section. Added BG121 information under iCE40HX4K and iCE40HX8K.
		Ordering Information	Updated iCE40 Part Number Description section. Added Shipping Method and BG121 package under High Performance (HX) Devices.
			Updated Ordering Information section. Added part numbers for BG121 under High-Performance Industrial Grade Devices, Halogen Free (RoHS) Packaging.
		Supplemental Information	Corrected reference to “Package Diagrams Data Sheet”.
October 2015	3.2	Introduction	Updated Features section. Added footnote to 16 WLCSP Programmable I/O: Max Inputs (LVDS25) in Table 1-1, iCE40 Family Selection Guide.
		DC and Switching Characteristics	Updated sysCLOCK PLL Timing section. Changed t_{DT} conditions. Updated Programming NVCM Supply Current – LP Devices section. Changed I_{PP_2V5} and I_{CCIO} , I_{CC_SPI} units.
March 2015	3.1	DC and Switching Characteristics	Updated sysIO Single-Ended DC Electrical Characteristics section. Changed LVCMOS 3.3 and LVCMOS 2.5 V_{OH} Min. (V) from 0.5 to 0.4.
July 2014	3.0	DC and Switching Characteristics	Revised and/or added Typ. V_{CC} data in the following sections. — Static Supply Current – LP Devices — Static Supply Current – HX Devices — Programming NVCM Supply Current – LP Devices — Programming NVCM Supply Current – HX Devices In each section table, the footnote indicating Advanced device status was removed.
		Pinout Information	Updated Pin Information Summary section. Added footnote 1 to CM49 under iCE40LP1K.
April 2014	02.9	Ordering Information	Changed “i” to “I” in part number description and ordering part numbers.
			Added part numbers to the Ultra Low Power Industrial Grade Devices, Halogen Free (RoHS) Packaging table.

Date	Version	Section	Change Summary
February 2014	02.8	Introduction	Updated Features section. — Corrected standby power units. — Included High Current LED Drivers
			Updated Table 1-1, iCE40 Family Selection Guide. — Removed LP384 Programmable I/O for 81 ucBGA package.
		Architecture	Updated Supported Standards section. Added information on High Current LED drivers.
		DC and Switching Characteristics	Corrected typos.
			Added footnote to the Peak Startup Supply Current – LP Devices table.
		Ordering Information	Updated part number description in the Ultra Low Power (LP) Devices section.
			Added part numbers to the Ultra Low Power Industrial Grade Devices, Halogen Free (RoHS) Packaging table.
October 2013	02.7	Introduction	Updated Features list and iCE40 Family Selection Guide table.
		Architecture	Revised iCE40-1K device to iCE40LP/HX1K device.
		DC and Switching Characteristics	Added iCE40LP640 device information.
		Pinout Information	Added iCE40LP640 and iCE40LP1K information.
		Ordering Information	Added iCE40LP640 and iCE40LP1K information.
September 2013	02.6	DC and Switching Characteristics	Updated Absolute Maximum Ratings section.
			Updated sysCLOCK PLL Timing – Preliminary table.
		Pinout Information	Updated Pin Information Summary table.
August 2013	02.5	Introduction	Updated the iCE40 Family Selection Guide table.
		DC and Switching Characteristics	Updated the following tables: — Absolute Maximum Ratings — Power-On-Reset Voltage Levels — Static Supply Current – LP Devices — Static Supply Current – HX Devices — Programming NVCM Supply Current – LP Devices — Programming NVCM Supply Current – HX Devices — Peak Startup Supply Current – LP Devices — sysIO Recommended Operating Conditions — Typical Building Block Function Performance – HX Devices — iCE40 External Switching Characteristics – HX Devices — sysCLOCK PLL Timing – Preliminary — SPI Master or NVCM Configuration Time
		Pinout Information	Updated the Pin Information Summary table.
July 2013	02.4	Introduction	Updated the iCE40 Family Selection Guide table.
		DC and Switching Characteristics	Updated the sysCONFIG Port Timing Specifications table.
			Updated footnote in DC Electrical Characteristics table.
			GDDR tables removed. Support to be provided in a technical note.
		Pinout Information	Updated the Pin Information Summary table.
		Ordering Information	Updated the top-side markings figure.
			Updated the Ultra Low Power Industrial Grade Devices, Halogen Free (RoHS) Packaging table.
May 2013	02.3	DC and Switching Characteristics	Added new data from Characterization.
