What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	ARM® Cortex®-M0+
Core Size	32-Bit Single-Core
Speed	32MHz
Connectivity	I²C, IrDA, SPI, UART/USART, USB
Peripherals	Brown-out Detect/Reset, DMA, I²S, LCD, POR, PWM, WDT
Number of I/O	51
Program Memory Size	32KB (32K x 8)
Program Memory Type	FLASH
EEPROM Size	2K x 8
RAM Size	8K x 8
Voltage - Supply (Vcc/Vdd)	1.65V ~ 3.6V
Data Converters	A/D 16x12b; D/A 1x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	64-LQFP
Supplier Device Package	64-LQFP (10x10)

3.4.3 Voltage regulator

The regulator has three operation modes: main (MR), low power (LPR) and power down.

- MR is used in Run mode (nominal regulation)
- LPR is used in the Low-power run, Low-power sleep and Stop modes
- Power down is used in Standby mode. The regulator output is high impedance, the kernel circuitry is powered down, inducing zero consumption but the contents of the registers and RAM are lost except for the standby circuitry (wakeup logic, IWDG, RTC, LSI, LSE crystal 32 KHz oscillator, RCC_CSR).

3.5 Clock management

The clock controller distributes the clocks coming from different oscillators to the core and the peripherals. It also manages clock gating for low-power modes and ensures clock robustness. It features:

- **Clock prescaler**

  To get the best trade-off between speed and current consumption, the clock frequency to the CPU and peripherals can be adjusted by a programmable prescaler.
- **Safe clock switching**

  Clock sources can be changed safely on the fly in Run mode through a configuration register.
- **Clock management**

  To reduce power consumption, the clock controller can stop the clock to the core, individual peripherals or memory.
- **System clock source**

  Three different clock sources can be used to drive the master clock SYSCLK:
  - 1-25 MHz high-speed external crystal (HSE), that can supply a PLL
  - 16 MHz high-speed internal RC oscillator (HSI), trimmable by software, that can supply a PLLMultispeed internal RC oscillator (MSI), trimmable by software, able to generate 7 frequencies (65 kHz, 131 kHz, 262 kHz, 524 kHz, 1.05 MHz, 2.1 MHz, 4.2 MHz). When a 32.768 kHz clock source is available in the system (LSE), the MSI frequency can be trimmed by software down to a ±0.5% accuracy.
- **Auxiliary clock source**

  Two ultra-low-power clock sources that can be used to drive the LCD controller and the real-time clock:
  - 32.768 kHz low-speed external crystal (LSE)
  - 37 kHz low-speed internal RC (LSI), also used to drive the independent watchdog. The LSI clock can be measured using the high-speed internal RC oscillator for greater precision.
- **RTC and LCD clock sources**

  The LSI, LSE or HSE sources can be chosen to clock the RTC and the LCD, whatever the system clock.
- **USB clock source**

  A 48 MHz clock trimmed through the USB SOF supplies the USB interface.

3.8 Memories

The STM32L053x6/8 devices have the following features:

- 8 Kbytes of embedded SRAM accessed (read/write) at CPU clock speed with 0 wait states. With the enhanced bus matrix, operating the RAM does not lead to any performance penalty during accesses to the system bus (AHB and APB buses).
- The non-volatile memory is divided into three arrays:
  - 32 or 64 Kbytes of embedded Flash program memory
  - 2 Kbytes of data EEPROM
  - Information block containing 32 user and factory options bytes plus 4 Kbytes of system memory

The user options bytes are used to write-protect or read-out protect the memory (with 4 Kbyte granularity) and/or readout-protect the whole memory with the following options:

- **Level 0**: no protection
- **Level 1**: memory readout protected.

  The Flash memory cannot be read from or written to if either debug features are connected or boot in RAM is selected
- **Level 2**: chip readout protected, debug features (Cortex-M0+ serial wire) and boot in RAM selection disabled (debugline fuse)

The firewall protects parts of code/data from access by the rest of the code that is executed outside of the protected area. The granularity of the protected code segment or the non-volatile data segment is 256 bytes (Flash memory or EEPROM) against 64 bytes for the volatile data segment (RAM).

The whole non-volatile memory embeds the error correction code (ECC) feature.

3.9 Boot modes

At startup, BOOT0 pin and nBOOT1 option bit are used to select one of three boot options:

- Boot from Flash memory
- Boot from System memory
- Boot from embedded RAM

The boot loader is located in System memory. It is used to reprogram the Flash memory by using SPI1(PA4, PA5, PA6, PA7) or SPI2 (PB12, PB13, PB14, PB15), USART1(PA9, PA10) or USART2(PA2, PA3). See STM32™ microcontroller system memory boot mode AN2606 for details.

6.3.10 EMC characteristics

Susceptibility tests are performed on a sample basis during device characterization.

Functional EMS (electromagnetic susceptibility)

While a simple application is executed on the device (toggling 2 LEDs through I/O ports). the device is stressed by two electromagnetic events until a failure occurs. The failure is indicated by the LEDs:

- **Electrostatic discharge (ESD)** (positive and negative) is applied to all device pins until a functional disturbance occurs. This test is compliant with the IEC 61000-4-2 standard.
- **FTB**: A Burst of Fast Transient voltage (positive and negative) is applied to V_{DD} and V_{SS} through a 100 pF capacitor, until a functional disturbance occurs. This test is compliant with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed.

The test results are given in *Table 53*. They are based on the EMS levels and classes defined in application note AN1709.

Table 53. EMS characteristics

Symbol	Parameter	Conditions	Level/ Class
V_{FESD}	Voltage limits to be applied on any I/O pin to induce a functional disturbance	V_{DD} = 3.3 V, LQFP64, T_A = +25 °C, f_{HCLK} = 32 MHz conforms to IEC 61000-4-2	3B
V_{EFTB}	Fast transient voltage burst limits to be applied through 100 pF on V_{DD} and V_{SS} pins to induce a functional disturbance	V_{DD} = 3.3 V, LQFP64, T_A = +25 °C, f_{HCLK} = 32 MHz conforms to IEC 61000-4-4	4A

Input/output AC characteristics

The definition and values of input/output AC characteristics are given in *Figure 24* and *Table 60*, respectively.

Unless otherwise specified, the parameters given in *Table 60* are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in *Table 24*.

2. The maximum SPI clock frequency in slave transmitter mode is determined by the sum of $t_{v(SO)}$ and $t_{su(MI)}$ which has to fit into SCK low or high phase preceding the SCK sampling edge. This value can be achieved when the SPI communicates with a master having $t_{su(MI)}$ = 0 while $Duty_{(SCK)}$ = 50%.

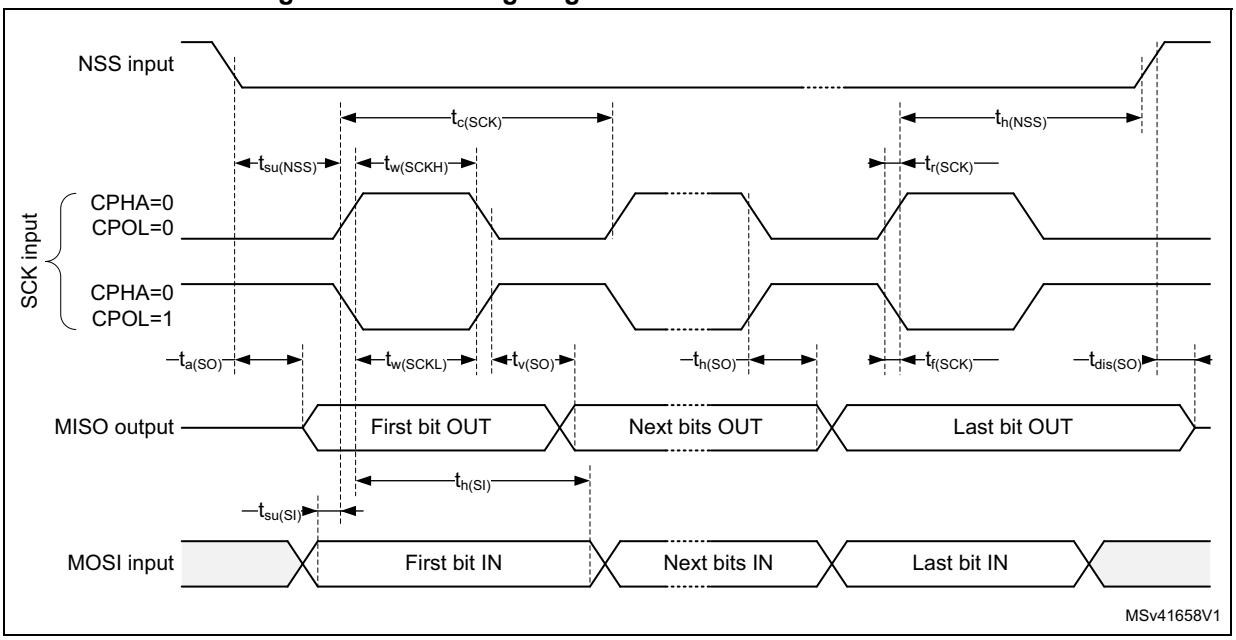

Figure 32. SPI timing diagram - slave mode and CPHA = 1(1)

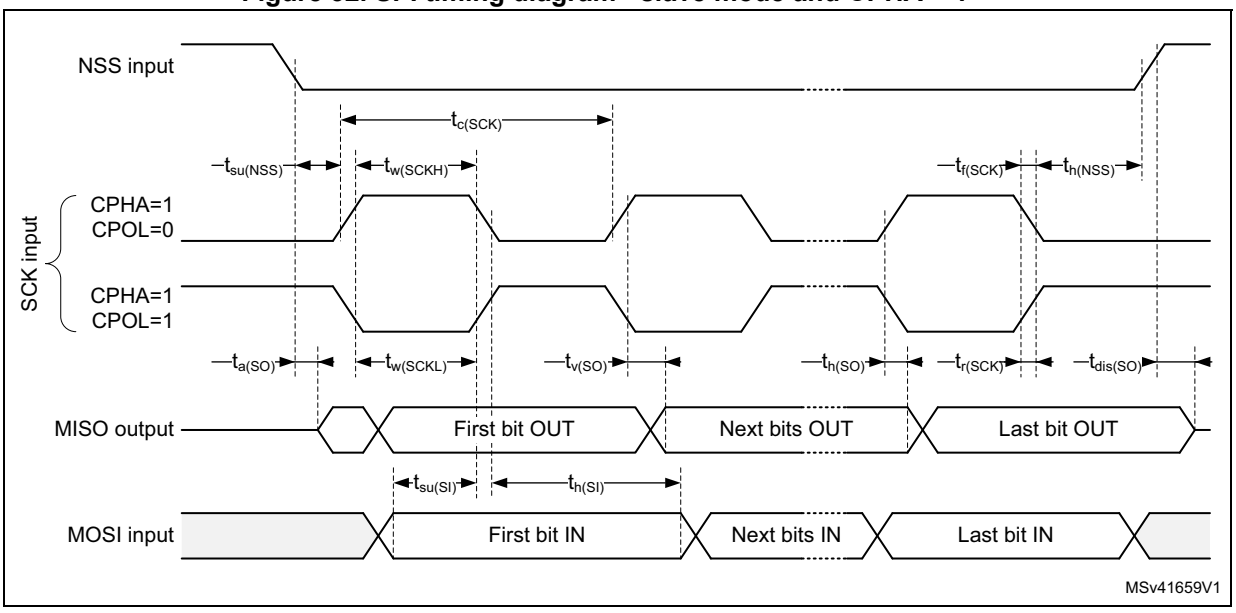
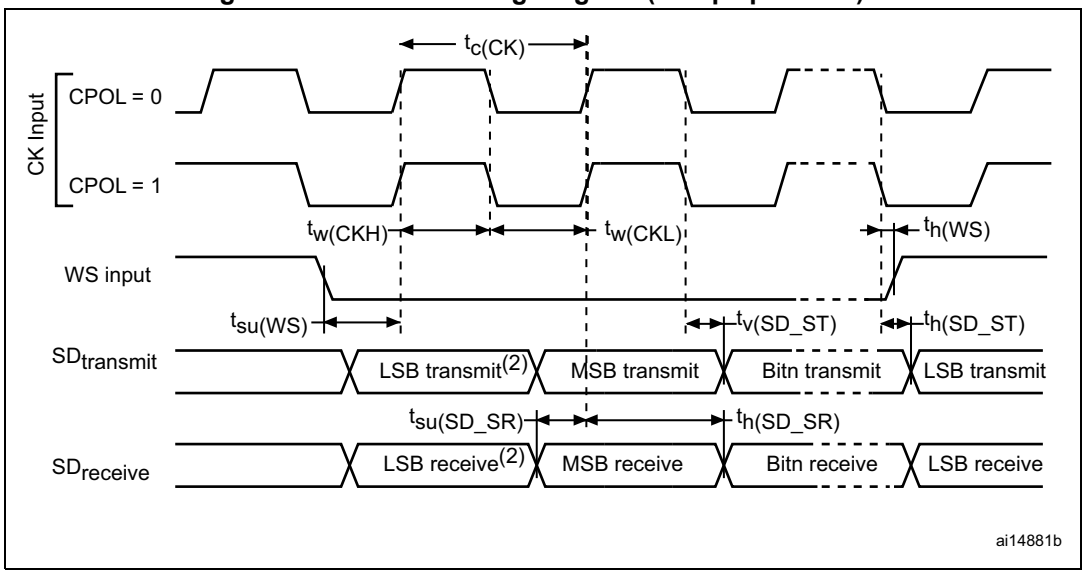


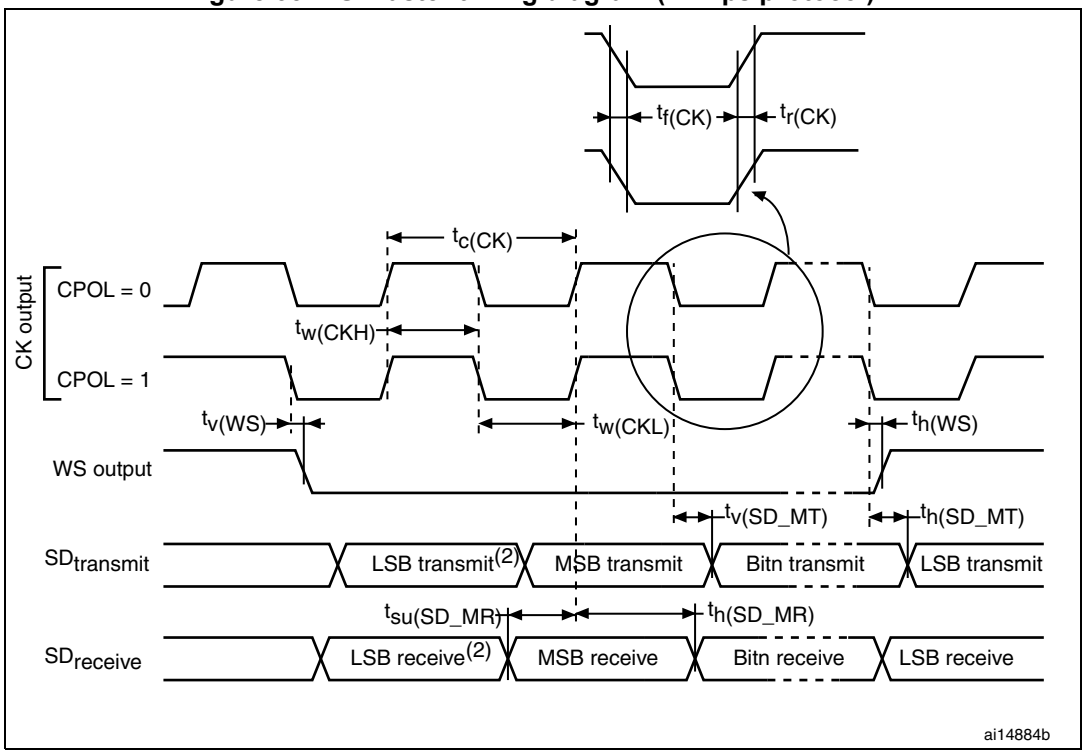
1. Measurement points are done at CMOS levels: $0.3V_{DD}$ and $0.7V_{DD}$.

Figure 34. I²S slave timing diagram (Philips protocol)(1)



1. Measurement points are done at CMOS levels: $0.3 \times V_{DD}$ and $0.7 \times V_{DD}$.
2. LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

Figure 35. I²S master timing diagram (Philips protocol)(1)



1. Guaranteed by characterization results.
2. LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

7.3 LQFP48 package information

1. Drawing is not to scale.

Device marking for LQFP48

The following figure gives an example of topside marking versus pin 1 position identifier location.

Other optional marking or inset/upset marks, which depend on supply chain operations, are not indicated below.

1. Parts marked as “ES”, “E” or accompanied by an Engineering Sample notification letter, are not yet qualified and therefore not yet ready to be used in production and any consequences deriving from such usage will not be at ST charge. In no event, ST will be liable for any customer usage of these engineering samples in production. ST Quality has to be contacted prior to any decision to use these Engineering samples to run qualification activity.

9 Revision history

Date	Revision	Changes
07-Feb-2014	1	Initial release.
29-Apr-2014	2	Updated *Table 4: Functionalities depending on the working mode (from Run/active down to standby)*. Added *Section 3.2: Interconnect matrix*. Updated *Figure 4: STM32L053x6/8 TFBGA64 ballout - 5x 5 mm*. Added VREF_OUT additional function to PB0 and PB1, replaced TTa I/O structure by TC, and updated PA0/4/5 and PC5/14 I/O structure, and added note 2 in *Table 15: STM32L053x6/8 pin definitions*. Updated *Table 24: General operating conditions*, *Table 21: Voltage characteristics* and *Table 22: Current characteristics*. Modified conditions in *Table 27: Embedded internal reference voltage*. Updated *Table 28: Current consumption in Run mode, code with data processing running from Flash*, *Table 30: Current consumption in Run mode, code with data processing running from RAM*, *Table 32: Current consumption in Sleep mode*, *Table 33: Current consumption in Low-power run mode*, *Table 34: Current consumption in Low-power sleep mode*,*Table 35: Typical and maximum current consumptions in Stop mode* and *Table 36: Typical and maximum current consumptions in Standby mode*. Added *Figure 12: IDD vs VDD, at TA= 25/55/85/105 °C, Run mode, code running from Flash memory, Range 2, HSE, 1WS*, *Figure 13: IDD vs VDD, at TA= 25/55/85/105 °C, Run mode, code running from Flash memory, Range 2, HSI16, 1WS*, *Figure 14: IDD vs VDD, at TA= 25/55/ 85/105/125 °C, Low-power run mode, code running from RAM, Range 3, MSI (Range 0) at 64 KHz, 0 WS*, *Figure 15: IDD vs VDD, at TA= 25/55/ 85/105/125 °C, Stop mode with RTC enabled and running on LSE Low drive* and *Figure 16: IDD vs VDD, at TA= 25/55/85/105/125 °C, Stop mode with RTC disabled, all clocks OFF*. Updated *Table 43: HSE oscillator characteristics* and *Table 44: LSE oscillator characteristics*. Added *Figure 21: HSI16 minimum and maximum value versus temperature*. Updated *Table 55: ESD absolute maximum ratings*, *Table 57: I/O current injection susceptibility*, *Table 58: I/O static characteristics*. Added *Figure 22: VIH/VIL versus VDD (CMOS I/Os)* and *Figure 23: VIH/VIL versus VDD (TTL I/Os)*. Updated *Table 59: Output voltage characteristics*, *Table 60: I/O AC characteristics* and *Figure 24: I/O AC characteristics definition*. Updated *Table 62: ADC characteristics*, *Table 64: ADC accuracy*, and *Figure 27: Typical connection diagram using the ADC*. Updated *Table 66: Temperature sensor calibration values*. Updated *Table 73: SPI characteristics in voltage Range 1* and *Table 76: I2S characteristics*. Added *Figure 46: Thermal resistance*.
