Welcome to [E-XFL.COM](#)**Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	1936
Total RAM Bits	94208
Number of I/O	160
Number of Gates	139000
Voltage - Supply	2.3V ~ 3.6V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 105°C (TJ)
Package / Case	256-BGA
Supplier Device Package	256-FPBGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfx125eb-04f256i

ispXPGA Family Overview

The ispXPGA family of devices provides the ideal vehicle for the creation of high-performance logic designs that are both non-volatile and infinitely re-programmable. Other FPGA solutions force a compromise, being either re-programmable or non-volatile. This family couples this capability with a mainstream architecture containing the features required for today's system-level design.

The ispXPGA family is available in two options. The standard device supports sysHSI capability for ultra fast serial communications while the lower-cost "E-Series" supports the same high-performance FPGA fabric without the sys-HSI Block.

Electrically Erasable CMOS (E²CMOS) memory cells provide the ispXPGA family with non-volatile capability. These allow logic to be functional microseconds after power is applied, allowing easy interfacing in many applications. This capability also means that expensive external configuration memories are not required and that designs can be secured from unauthorized read back. Internal SRAM cells allow the device to be infinitely reconfigured if desired. Both the SRAM and E²CMOS cells can be programmed and verified through the IEEE 1532 industry standard. Additionally, the SRAM cells can be configured and read-back through the sysCONFIG™ peripheral port.

The family spans the density and I/O range required for the majority of today's logic designs, 139K to 1.25M functional gates and 160 to 496 I/O. The devices are available for operation from 1.8V, 2.5V, and 3.3V power supplies, providing easy integration into the overall system.

System-level design needs are met through the incorporation of sysMEM dual-port memory blocks, sysIO advanced I/O support, and sysCLOCK Phase Locked Loops (PLLs). High-speed serial communications are supported through multiple sysHSI blocks, which provide clock data recovery (CDR) and serialization/de-serialization (SERDES).

The ispLEVER™ design tool from Lattice allows easy implementation of designs using the ispXPGA product. Synthesis library support is available for major logic synthesis tools. The ispLEVER tool takes the output from these common synthesis packages and place and routes the design in the ispXPGA product. The tool supports floor planning and the management of other constraints within the device. The tool also provides outputs to common timing analysis tools for timing analysis.

To increase designer productivity, Lattice provides a variety of pre-designed modules referred to as IP cores for the ispXPGA product. These IP cores allow designers to concentrate on the unique portions of their design while using pre-designed blocks to implement standard functions such as bus interfaces, standard communication interfaces, and memory controllers.

Through the use of advanced technology and innovative architecture the ispXPGA FPGA devices provide designers with excellent speed performance. Although design dependent, many typical designs can run at over 150MHz. Certain designs can run at over 300MHz. Table 2 details the performance of several building blocks commonly used by logic designers.

Table 2. ispXPGA Speed Performance for Typical Building Blocks

Function	Performance
8:1 Asynch MUX	150 MHz
1:32 Asynch Demultiplexer	125 MHz
8 x 8 2-LL Pipelined Multiplier	225 MHz
32-bit Up/Down Counter	290 MHz
32-bit Shift Register	360 MHz

sysCLOCK PLL Description

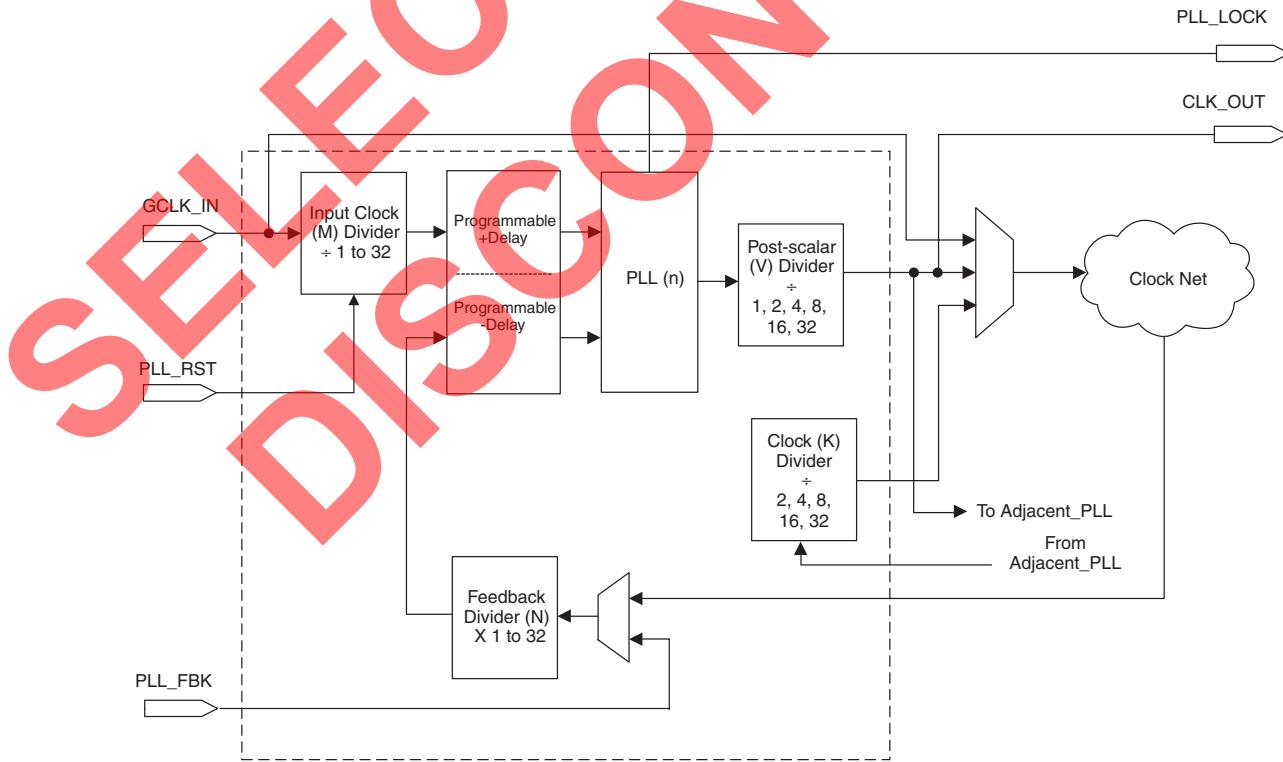

The sysCLOCK PLL circuitry consists of Phase-Lock Loops (PLLs) and the various dividers, reset, and feedback signals associated with the PLLs. This feature gives the user the ability to synthesize clock frequencies and generate multiple clock signals for routing within the device. Furthermore, it can generate clock signals that are aligned either at the board level or the device level.

The ispXPGA devices provide up to eight PLLs. Each PLL receives its input clock from its associated global clock pin, and its output is routed to the associated global clock net. For example, PLL0 receives its clock input from the GCLK0 global clock pin and provides output to the CLK0 global clock net. The PLL also has the ability to output a secondary clock that is a division of the primary clock output. When using the secondary clock, the secondary clock will be routed to the neighboring global clock net. For example, PLL0 will drive its primary clock output on the CLK0 global clock net and its secondary clock output will drive the CLK1 global clock net. Additionally, each PLL has a set of PLL_RST, PLL_FBK, and PLL_LOCK signals. The PLL_RST signal can be generated through routing or a dedicated dual-function I/O pin. The PLL_FBK signal can be generated through a dedicated dual-function I/O pin or internally from the Global Clock net associated with the PLL. The PLL_LOCK signal feeds routing directly from the sysCLOCK PLL circuit. Figure 17 illustrates how the PLL_RST and PLL_FBK signals are generated.

Each PLL has four dividers associated with it, M, N, V, and K. The M divider is used to divide the clock signal, while the N divider is used to multiply the clock signal. The V divider allows the VCO frequency to operate at higher frequencies than the clock output, thereby increasing the frequency range. The K divider is only used when a secondary clock output is needed. This divider divides the primary clock output and feeds to the adjacent global clock net. Different combinations of these dividers allow the user to synthesize clock frequencies. Figure 16 shows the ispXPGA PLL block diagram.

The PLL also has a delay feature that allows the output clock to be advanced or delayed to improve set-up and clock-to-out times for better performance. This operates by inserting delay on the input or feedback lines of the PLL. For more information on the PLL, please refer to TN1003, [sysCLOCK PLL Usage and Design Guidelines](#).

Figure 16. ispXPGA PLL Block Diagram

Absolute Maximum Ratings^{1, 2, 3}

	1.8V	2.5V/3.3V
Supply Voltage (V_{CC})	-0.5 to 2.5V	-0.5 to 5.5V
PLL Supply Voltage (V_{CCP})	-0.5 to 2.5V	-0.5 to 5.5V
Output Supply Voltage (V_{CCO})	-0.5 to 4.5V	-0.5 to 4.5V
IEEE 1149.1 TAP Supply Voltage (V_{CCJ})	-0.5 to 4.5V	-0.5 to 4.5V
Input Voltage Applied ^{4, 5}	-0.5 to 5.5V	-0.5 to 5.5V
Storage Temperature	-65 to 150°C	-65 to 150°C
Junction Temperature (T_J) with Power Applied	-55 to 150°C	-55 to 150°C

1. Stress above those listed under the “Absolute Maximum Ratings” may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied (while programming, following the programming specifications).
2. Compliance with the Lattice [Thermal Management](#) document is required.
3. All voltages referenced to GND.
4. Overshoot and undershoot of -2V to (V_{IH} (MAX) + 2) volts not to exceed 6V is permitted for a duration of <20ns.
5. A maximum of 64 I/Os per device with $V_{IN} > 3.6V$ is allowed.

Recommended Operating Conditions

Symbol	Parameter	Min	Max	Units
V_{CC}	Supply Voltage for 1.8V device ¹	1.65	1.95	V
	Supply Voltage for 2.5V device	2.3	2.7	V
	Supply Voltage for 3.3V device	3.0	3.6	V
V_{CCP}	Supply Voltage for PLL and sysHSI blocks, 1.8V devices ¹	1.65	1.95	V
	Supply Voltage for PLL and sysHSI blocks, 2.5V devices	2.3	2.7	V
	Supply Voltage for PLL and sysHSI blocks, 3.3V devices	3.0	3.6	V
V_{CCJ}	Supply Voltage for IEEE 1149.1 Test Access Port for LVCMOS 1.8V	1.65	1.95	V
	Supply Voltage for IEEE 1149.1 Test Access Port for LVCMOS 2.5V	2.3	2.7	V
	Supply Voltage for IEEE 1149.1 Test Access Port for LVCMOS 3.3V	3.0	3.6	V
T_J (COM)	Junction Temperature Commercial Operation	0	85	C
T_J (IND)	Junction Temperature Industrial Operation	-40	105	C

1. sysHSI specification is valid for V_{CC} and $V_{CCP} = 1.7V$ to $1.9V$.

E²CMOS Erase Reprogram Specifications

Parameter	Min	Max	Units
Erase/Reprogram Cycle ¹	1,000	—	Cycles

1. Valid over commercial temperature range.

Hot Socketing Characteristics^{1, 2, 3, 4}

Symbol	Parameter	Condition	Min	Typ	Max	Units
I_{DK}	Input or Tristated I/O Leakage Current	$0 \leq V_{IN} \leq 3.0V$	—	+/-50	+/-800	μA

1. Insensitive to sequence of V_{CC} and V_{CCO} when $V_{CCO} \geq 1.0V$. For $V_{CCO} > 1.0V$, V_{CC} min must be present. However, assumes monotonic rise/fall rates for V_{CC} and V_{CCO} , provided $(V_{IN} - V_{CCO}) \geq 3.6V$.

2. LVTTL, LVCMOS only.

3. $0 < V_{CC} \leq V_{CC}$ (MAX), $0 < V_{CCO} \leq V_{CCO}$ (MAX).

4. I_{DK} is additive to I_{PU} , I_{PD} or I_{BH} . Device defaults to pull-up until non-volatile cells are active.

1. Design tool default setting.
2. The average DC current drawn by I/Os between adjacent bank GND connections, or between the last GND in an I/O bank and the end of the I/O bank, as shown in the logic signals connection table, shall not exceed n*8mA. Where n is the number of I/Os between bank GND connections or between the last GND in a bank and the end of a bank
3. Applicable for ispXPGA B devices.

t _{EBSRDIS}	Output Enable to Data Disable Time	—	0.83	—	0.86	—	0.99	ns
Asynchronous Read								
t _{EBARADO}	Address to New Valid Data Delay	—	2.39	—	2.46	—	2.83	ns
t _{EBARAD_H}	Address to Previous Valid Data Delay	—	2.10	—	2.17	—	2.50	ns
t _{EBARWEEN}	Write Enable to Data Enable Time	—	1.01	—	1.04	—	1.20	ns
t _{EBARWEDIS}	Write Enable to Data Disable Time	—	0.98	—	1.01	—	1.16	ns
t _{EBAREN}	Output Enable to Data Enable Time	—	1.02	—	1.05	—	1.21	ns
t _{EBARDIS}	Output Enable to Data Disable Time	—	0.83	—	0.86	—	0.99	ns

1. Only available for ispXPGA 1200B and ispXPGA 1200EB (2.5V/3.3V) devices.

Timing v.2.1

Signal Descriptions¹

Signal Name	Signal Type	Description
General Purpose		
BKy_Io ^{x²}	Input/Output	General purpose I/O number x in I/O Bank y
GCLK _n /In ⁷	Input	Global clock/input ⁸
GSR	Input	Global Set/Reset
NC	—	No Connect
GND	GND	Ground
V _{CC}	VCC	Core logic power supply
V _{CCJ}	VCC	IEEE 1149.1 TAP power supply
V _{CCOy²}	VCC	I/O Bank y power supply
V _{REFy²}	Input	I/O Bank y reference voltage
D _{XN} , D _{XP}	Output	Temperature Sensing Diodes, provide a differential voltage, which corresponds to the temperature of the device.
Test and Program/Configuration		
TMS	Input	Test Mode Select
TCK	Input	Test Clock
TDI	Input	Test Data In
TDO	Output	Test Data Out
TOE	Input	Test Output Enable tri-states all I/O pins when driven low
CFG0	Input	Selects the SRAM memory configuration type (Peripheral or E ² C MOS Refresh)
PROGRAMb	Input	Initiates download from E ² C MOS or the peripheral port to SRAM memory (active low)
DONE	Bi-directional	Indicates when configuration is complete
INITb	Bi-directional	Indicates the device is ready for programming (active low)
READ	Input	Selects the READ operation when in sysCONFIG mode
CCLK	Input	sysCONFIG Configuration Clock
CSb	Input	sysCONFIG Chip Select (active low)
DATA[0:7]	Bi-directional	sysCONFIG Peripheral Port Data I/O
sysCLOCK PLL³		
PLL_FBKz	Input	Optional external feedback
PLL_RSTz	Input	Optional external M divider reset
CLK_OUTz	Internal Signal	Clock output (routable to any I/O)
PLL_LOCKz	Internal Signal	Lock output (routable to any I/O)
GND _{P0}	GND	Left side PLL Ground
GND _{P1}	GND	Right side PLL Ground
V _{CCP0}	VCC	Left side PLL power supply
V _{CCP1}	VCC	Right side PLL power supply
sysHSI Block^{4,5}		
HSImA_SINP, HSImB_SINP	Input	P-side of differential serial data input
HSImA_SINN, HSImB_SINN	Input	N-side of differential serial data input
HSImA_SOUTP, HSImB_SOUTP	Output	P-side of differential serial data output
HSImA_SOUTN, HSImB_SOUTN	Output	N-side of differential serial data output
HSImA_SYDT, HSImB_SYDT	Internal Signal	Symbol alignment detect
HSImA_RECCLK, HSImB_RECCLK	Internal Signal	Recovered clock

Revision History (Cont.)

Date	Version	Change Summary
June 2004 (cont.)	08.0 (cont.)	Updated Global Clock Input Setup time specifications.
		Clarification of Serial Out LVDS test condition.
		Clarification of REFCLK, SS_CLKIN peak-to-peak period jitter condition.
		Added sysHSI Reserved pins and footnote.
		Removed industrial ordering part numbers.
July 2004	09.0	Added "E" Series product family.
August 2004	10.0	Final release.
December 2004	10.1	Updated NC Connections table.
April 2005	10.2	Clarification of IDK specification.
April 2005	11.0	Select lead-free packages release.
July 2005	12.0	Added lead-free 516 fpBGA ordering part numbers.
April 2007	13.0	Removed lead-free 680 fpSBGA information from Part Number Description and Ordering Part Number tables. Removed lead-free 516 fpBGA for LFX125 from Ordering Part Number tables.
November 2007	14.0	Removed lead-free 516 fpBGA information from Part Number Description and Ordering Part Number tables.
July 2008	14.1	Added 516 fpBGA package without heat spreader to Part Number Description and Ordering Part Number tables.
February 2010	15.0	Ordering part numbers and ispXPGA Family Selection Guide table have been updated per PCN #03A-10 (discontinuation of the ispXPGA 1200 devices).
		References to "system gates" changed to "functional gates."
