

Welcome to [E-XFL.COM](https://www.e-xfl.com)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

#### Details

Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	8MHz
Connectivity	I <sup>2</sup> C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	50
Program Memory Size	32KB (16K x 16)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	902 x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 5.5V
Data Converters	A/D 12x10b
Oscillator Type	External
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	68-LCC (J-Lead)
Supplier Device Package	68-PLCC (24.23x24.23)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/pic17lc756a-08i-l">https://www.e-xfl.com/product-detail/microchip-technology/pic17lc756a-08i-l</a>

# PIC17C7XX

---

NOTES:

## 2.0 DEVICE VARIETIES

Each device has a variety of frequency ranges and packaging options. Depending on application and production requirements, the proper device option can be selected using the information in the PIC17C7XX Product Selection System section at the end of this data sheet. When placing orders, please use the "PIC17C7XX Product Identification System" at the back of this data sheet to specify the correct part number. When discussing the functionality of the device, memory technology and voltage range does not matter.

There are two memory type options. These are specified in the middle characters of the part number.

1. **C**, as in PIC17**C**756A. These devices have EPROM type memory.
2. **CR**, as in PIC17**CR**756A. These devices have ROM type memory.

All these devices operate over the standard voltage range. Devices are also offered which operate over an extended voltage range (and reduced frequency range). Table 2-1 shows all possible memory types and voltage range designators for a particular device. These designators are in **bold** typeface.

**TABLE 2-1: DEVICE MEMORY VARIETIES**

Memory Type	Voltage Range	
	Standard	Extended
EPROM	PIC17 <b>C</b> XXX	PIC17 <b>LC</b> XXX
ROM	PIC17 <b>CR</b> XXX	PIC17 <b>LCR</b> XXX
<b>Note:</b> Not all memory technologies are available for a particular device.		

### 2.1 UV Erasable Devices

The UV erasable version, offered in CERQUAD package, is optimal for prototype development and pilot programs.

The UV erasable version can be erased and reprogrammed to any of the configuration modes. Third party programmers also are available; refer to the *Third Party Guide* for a list of sources.

### 2.2 One-Time-Programmable (OTP) Devices

The availability of OTP devices is especially useful for customers expecting frequent code changes and updates.

The OTP devices, packaged in plastic packages, permit the user to program them once. In addition to the program memory, the configuration bits must be programmed.

## 2.3 Quick-Turnaround-Production (QTP) Devices

Microchip offers a QTP Programming Service for factory production orders. This service is made available for users who choose not to program a medium to high quantity of units and whose code patterns have stabilized. The devices are identical to the OTP devices but with all EPROM locations and configuration options already programmed by the factory. Certain code and prototype verification procedures apply before production shipments are available. Please contact your local Microchip Technology sales office for more details.

### 2.4 Serialized Quick-Turnaround Production (SQTP<sup>sm</sup>) Devices

Microchip offers a unique programming service, where a few user defined locations in each device are programmed with different serial numbers. The serial numbers may be random, pseudo-random or sequential.

Serial programming allows each device to have a unique number which can serve as an entry code, password or ID number.

### 2.5 Read Only Memory (ROM) Devices

Microchip offers masked ROM versions of several of the highest volume parts, thus giving customers a low cost option for high volume, mature products.

ROM devices do not allow serialization information in the program memory space.

For information on submitting ROM code, please contact your regional sales office.

**Note:** Presently, NO ROM versions of the PIC17C7XX devices are available.

# PIC17C7XX

Example 9-3 shows the sequence to do a 16 x 16 unsigned multiply. Equation 9-1 shows the algorithm that is used. The 32-bit result is stored in 4 registers, RES3:RES0.

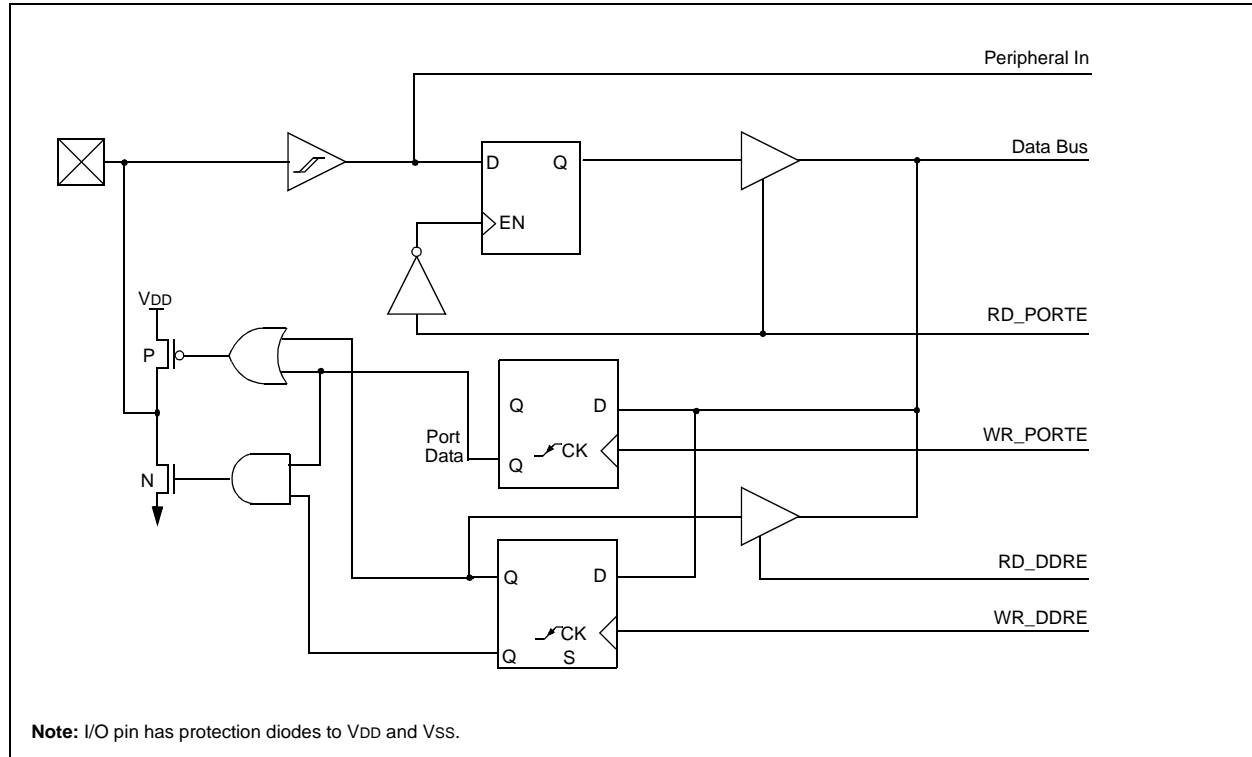

## EQUATION 9-1: 16 x 16 UNSIGNED MULTIPLICATION ALGORITHM

$$\begin{aligned} \text{RES3:RES0} &= \text{ARG1H:ARG1L} \bullet \text{ARG2H:ARG2L} \\ &= (\text{ARG1H} \bullet \text{ARG2H} \bullet 2^{16}) + \\ &\quad (\text{ARG1H} \bullet \text{ARG2L} \bullet 2^8) + \\ &\quad (\text{ARG1L} \bullet \text{ARG2H} \bullet 2^8) + \\ &\quad (\text{ARG1L} \bullet \text{ARG2L}) \end{aligned}$$

## EXAMPLE 9-3: 16 x 16 UNSIGNED MULTIPLY ROUTINE

```
MOVFP ARG1L, WREG
MULWF ARG2L      ; ARG1L * ARG2L ->
                  ; PRODH:PRODL
MOVFP PRODH, RES1 ;
MOVFP PRODL, RES0 ;
;
MOVFP ARG1H, WREG
MULWF ARG2H      ; ARG1H * ARG2H ->
                  ; PRODH:PRODL
MOVFP PRODH, RES3 ;
MOVFP PRODL, RES2 ;
;
MOVFP ARG1L, WREG
MULWF ARG2H      ; ARG1L * ARG2H ->
                  ; PRODH:PRODL
MOVFP PRODL, WREG ;
ADDWF RES1, F     ; Add cross
MOVFP PRODH, WREG ; products
ADDWFC RES2, F    ;
CLRF WREG, F      ;
ADDWFC RES3, F    ;
;
MOVFP ARG1H, WREG ;
MULWF ARG2L      ; ARG1H * ARG2L ->
                  ; PRODH:PRODL
MOVFP PRODL, WREG ;
ADDWF RES1, F     ; Add cross
MOVFP PRODH, WREG ; products
ADDWFC RES2, F    ;
CLRF WREG, F      ;
ADDWFC RES3, F    ;
```

**FIGURE 10-12: BLOCK DIAGRAM OF RE3/CAP4 PORT PIN**

**TABLE 10-9: PORTE FUNCTIONS**

Name	Bit	Buffer Type	Function
RE0/ALE	bit0	TTL	Input/output or system bus Address Latch Enable (ALE) control pin.
RE1/OE	bit1	TTL	Input/output or system bus Output Enable (OE) control pin.
RE2/WR	bit2	TTL	Input/output or system bus Write (WR) control pin.
RE3/CAP4	bit3	ST	Input/output or Capture4 input pin.

Legend: TTL = TTL input, ST = Schmitt Trigger input

**TABLE 10-10: REGISTERS/BITS ASSOCIATED WITH PORTE**

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Value on POR, BOR	MCLR, WDT
15h, Bank 1	PORTE	—	—	—	—	RE3/CAP4	RE2/WR	RE1/OE	RE0/ALE	---- xxxx	---- uuuu
14h, Bank 1	DDRE	Data Direction Register for PORTE								---- 1111	---- 1111
14h, Bank 7	CA4L	Capture4 Low Byte								xxxx xxxx	uuuu uuuu
15h, Bank 7	CA4H	Capture4 High Byte								xxxx xxxx	uuuu uuuu
16h, Bank 7	TCON3	—	CA4OVF	CA3OVF	CA4ED1	CA4ED0	CA3ED1	CA3ED0	PWM3ON	-000 0000	-000 0000

Legend: x = unknown, u = unchanged, - = unimplemented, read as '0'. Shaded cells are not used by PORTE.

## 12.3 Read/Write Consideration for TMR0

Although TMR0 is a 16-bit timer/counter, only 8-bits at a time can be read or written during a single instruction cycle. Care must be taken during any read or write.

### 12.3.1 READING 16-BIT VALUE

The problem in reading the entire 16-bit value is that after reading the low (or high) byte, its value may change from FFh to 00h.

Example 12-1 shows a 16-bit read. To ensure a proper read, interrupts must be disabled during this routine.

#### EXAMPLE 12-1: 16-BIT READ

```
MOVFP   TMR0L, TMPLO    ;read low tmr0
MOVFP   TMR0H, TMPHI    ;read high tmr0
MOVFP   TMPLO, WREG      ;tmplo -> wreg
CPFSLT  TMR0L            ;tmr0l < wreg?
RETURN  ;no then return
MOVFP   TMR0L, TMPLO    ;read low tmr0
MOVFP   TMR0H, TMPHI    ;read high tmr0
RETURN  ;return
```

### 12.3.2 WRITING A 16-BIT VALUE TO TMR0

Since writing to either TMR0L or TMR0H will effectively inhibit increment of that half of the TMR0 in the next cycle (following write), but not inhibit increment of the other half, the user must write to TMR0L first and TMR0H second, in two consecutive instructions, as shown in Example 12-2. The interrupt must be disabled. Any write to either TMR0L or TMR0H clears the prescaler.

#### EXAMPLE 12-2: 16-BIT WRITE

```
BSF      CPUSTA, GLINTD ; Disable interrupts
MOVFP    RAM_L, TMR0L   ;
MOVFP    RAM_H, TMR0H   ;
BCF      CPUSTA, GLINTD ; Done, enable
                        ; interrupts
```

## 12.4 Prescaler Assignments

Timer0 has an 8-bit prescaler. The prescaler selection is fully under software control; i.e., it can be changed “on the fly” during program execution. Clearing the prescaler is recommended before changing its setting. The value of the prescaler is “unknown” and assigning a value that is less than the present value, makes it difficult to take this unknown time into account.

FIGURE 12-3: TMR0 TIMING: WRITE HIGH OR LOW BYTE

# PIC17C7XX

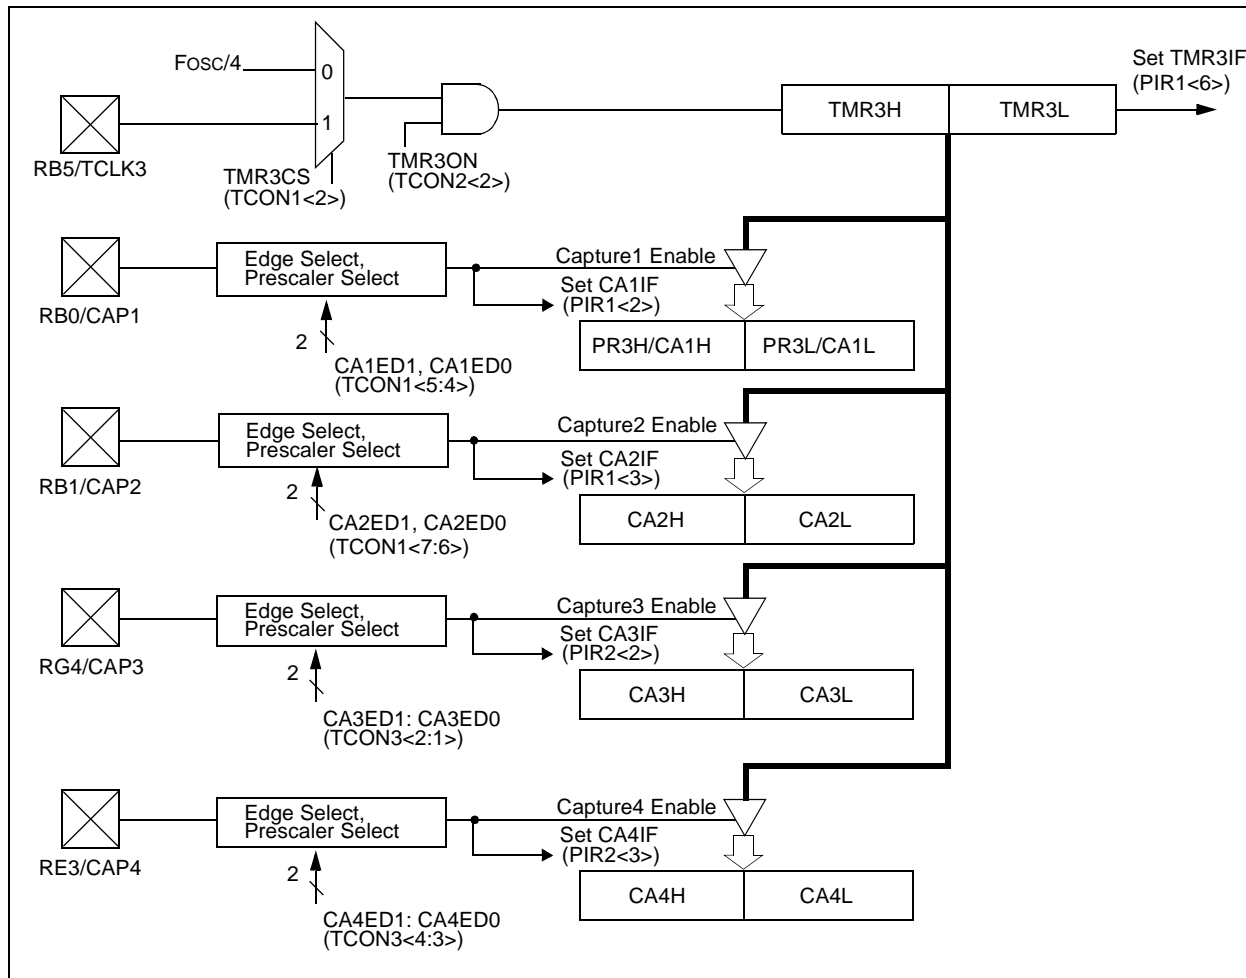

## 13.2.2 FOUR CAPTURE MODE

This mode is selected by setting bit CA1/PR3. A block diagram is shown in Figure 13-6. In this mode, TMR3 runs without a period register and increments from 0000h to FFFFh and rolls over to 0000h. The TMR3 interrupt Flag (TMR3IF) is set on this rollover. The TMR3IF bit must be cleared in software.

Registers PR3H/CA1H and PR3L/CA1L make a 16-bit capture register (Capture1). It captures events on pin RB0/CAP1. Capture mode is configured by the CA1ED1 and CA1ED0 bits. Capture1 Interrupt Flag bit (CA1IF) is set upon detection of the capture event. The corresponding interrupt mask bit is CA1IE. The Capture1 Overflow Status bit is CA1OVF.

All the captures operate in the same manner. Refer to Section 13.2.1 for the operation of capture.

**FIGURE 13-6: TIMER3 WITH FOUR CAPTURES BLOCK DIAGRAM**

# PIC17C7XX

The USART can be configured as a full duplex asynchronous system that can communicate with peripheral devices such as CRT terminals and personal computers, or it can be configured as a half duplex synchronous system that can communicate with peripheral devices such as A/D or D/A integrated circuits, Serial EEPROMs etc. The USART can be configured in the following modes:

- Asynchronous (full duplex)
- Synchronous - Master (half duplex)
- Synchronous - Slave (half duplex)

The SPEN (RCSTA<7>) bit has to be set in order to configure the I/O pins as the Serial Communication Interface (USART).

The USART module will control the direction of the RX/DT and TX/CK pins, depending on the states of the USART configuration bits in the RCSTA and TXSTA registers. The bits that control I/O direction are:

- SPEN
- TXEN
- SREN
- CREN
- CSRC

## REGISTER 14-2: RCSTA1 REGISTER (ADDRESS: 13h, BANK 0) RCSTA2 REGISTER (ADDRESS: 13h, BANK 4)

R/W-0	R/W-0	R/W-0	R/W-0	U-0	R-0	R-0	R-x
SPEN	RX9	SREN	CREN	—	FERR	OERR	RX9D
bit 7							bit 0

- bit 7 **SPEN:** Serial Port Enable bit  
1 = Configures TX/CK and RX/DT pins as serial port pins  
0 = Serial port disabled
- bit 6 **RX9:** 9-bit Receive Select bit  
1 = Selects 9-bit reception  
0 = Selects 8-bit reception
- bit 5 **SREN:** Single Receive Enable bit  
This bit enables the reception of a single byte. After receiving the byte, this bit is automatically cleared.  
Synchronous mode:  
1 = Enable reception  
0 = Disable reception  
**Note:** This bit is ignored in synchronous slave reception.  
Asynchronous mode:  
Don't care
- bit 4 **CREN:** Continuous Receive Enable bit  
This bit enables the continuous reception of serial data.  
Asynchronous mode:  
1 = Enable continuous reception  
0 = Disables continuous reception  
Synchronous mode:  
1 = Enables continuous reception until CREN is cleared (CREN overrides SREN)  
0 = Disables continuous reception
- bit 3 **Unimplemented:** Read as '0'
- bit 2 **FERR:** Framing Error bit  
1 = Framing error (updated by reading RCREG)  
0 = No framing error
- bit 1 **OERR:** Overrun Error bit  
1 = Overrun (cleared by clearing CREN)  
0 = No overrun error
- bit 0 **RX9D:** 9th bit of Receive Data (can be the software calculated parity bit)

### Legend:

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
- n = Value at POR Reset	'1' = Bit is set	'0' = Bit is cleared    x = Bit is unknown

## 18.2 Q Cycle Activity

Each instruction cycle (Tcy) is comprised of four Q cycles (Q1-Q4). The Q cycle is the same as the device oscillator cycle (Tosc). The Q cycles provide the timing/designation for the Decode, Read, Process Data, Write, etc., of each instruction cycle. The following diagram shows the relationship of the Q cycles to the instruction cycle.

The four Q cycles that make up an instruction cycle (Tcy) can be generalized as:

Q1: Instruction Decode Cycle or forced No operation

Q2: Instruction Read Cycle or No operation

Q3: Process the Data

Q4: Instruction Write Cycle or No operation

Each instruction will show the detailed Q cycle operation for the instruction.

**FIGURE 18-2: Q CYCLE ACTIVITY**

ADDWFC		ADD WREG and Carry bit to f						
Syntax:	[ <i>label</i> ] ADDWFC    f,d							
Operands:	0 ≤ f ≤ 255 d ∈ [0,1]							
Operation:	(WREG) + (f) + C → (dest)							
Status Affected:	OV, C, DC, Z							
Encoding:	<table border="1"><tr><td>0001</td><td>000d</td><td>ffff</td><td>ffff</td></tr></table>				0001	000d	ffff	ffff
0001	000d	ffff	ffff					
Description:	Add WREG, the Carry Flag and data memory location 'f'. If 'd' is 0, the result is placed in WREG. If 'd' is 1, the result is placed in data memory location 'f'.							
Words:	1							
Cycles:	1							
Q Cycle Activity:								
	Q1	Q2	Q3	Q4				
	Decode	Read register 'f'	Process Data	Write to destination				

**Example:** ADDWFC REG 0

**Before Instruction**

Carry bit = 1  
REG = 0x02  
WREG = 0x4D

**After Instruction**

Carry bit = 0  
REG = 0x02  
WREG = 0x50

ANDLW		And Literal with WREG						
Syntax:	[ <i>label</i> ] ANDLW    k							
Operands:	0 ≤ k ≤ 255							
Operation:	(WREG) .AND. (k) → (WREG)							
Status Affected:	Z							
Encoding:	<table border="1"><tr><td>1011</td><td>0101</td><td>kkkk</td><td>kkkk</td></tr></table>				1011	0101	kkkk	kkkk
1011	0101	kkkk	kkkk					
Description:	The contents of WREG are AND'd with the 8-bit literal 'k'. The result is placed in WREG.							
Words:	1							
Cycles:	1							
Q Cycle Activity:								
	Q1	Q2	Q3	Q4				
	Decode	Read literal 'k'	Process Data	Write to WREG				

**Example:** ANDLW 0x5F

**Before Instruction**

WREG = 0xA3

**After Instruction**

WREG = 0x03

Compare f with WREG, skip if f = WREG				
<b>CPFSEQ</b>				
Syntax:	[ <i>label</i> ] CPFSEQ f			
Operands:	0 ≤ f ≤ 255			
Operation:	(f) – (WREG), skip if (f) = (WREG) (unsigned comparison)			
Status Affected:	None			
Encoding:	0011	0001	ffff	ffff
Description:	Compares the contents of data memory location 'f' to the contents of WREG by performing an unsigned subtraction. If 'f' = WREG, then the fetched instruction is discarded and a NOP is executed instead, making this a two-cycle instruction.			
Words:	1			
Cycles:	1 (2)			
Q Cycle Activity:				
	Q1	Q2	Q3	Q4
	Decode	Read register 'f'	Process Data	No operation
If skip:				
	Q1	Q2	Q3	Q4
	No operation	No operation	No operation	No operation

**Example:**

```

HERE    CPFSEQ REG
NEQUAL  :
EQUAL   :

```

**Before Instruction**

```

PC Address = HERE
WREG       = ?
REG        = ?

```

**After Instruction**

```

If REG     = WREG;
PC         = Address (EQUAL)
If REG     ≠ WREG;
PC         = Address (NEQUAL)

```

Compare f with WREG, skip if f > WREG								
<b>CPFSGT</b>								
Syntax:	[ <i>label</i> ] CPFSGT f							
Operands:	$0 \leq f \leq 255$							
Operation:	(f) – (WREG), skip if (f) > (WREG) (unsigned comparison)							
Status Affected:	None							
Encoding:	<table><tr><td>0011</td><td>0010</td><td>ffff</td><td>ffff</td></tr></table>				0011	0010	ffff	ffff
0011	0010	ffff	ffff					
Description:	Compares the contents of data memory location 'f' to the contents of the WREG by performing an unsigned subtraction.  If the contents of 'f' are greater than the contents of WREG, then the fetched instruction is discarded and a NOP is executed instead, making this a two-cycle instruction.							
Words:	1							
Cycles:	1 (2)							
Q Cycle Activity:								
	Q1	Q2	Q3	Q4				
	Decode	Read register 'f'	Process Data	No operation				
If skip:								
	Q1	Q2	Q3	Q4				
	No operation	No operation	No operation	No operation				

**Example:**

```

HERE    CPFSGT REG
NGREATER :
GREATER  :

```

**Before Instruction**

```

PC       = Address (HERE)
WREG     = ?

```

**After Instruction**

```

If REG   > WREG;
PC       = Address (GREATER)
If REG   ≤ WREG;
PC       = Address (NGREATER)

```

## TABLWT Table Write

**Example 1:** TABLWT 1, 1, REG

Before Instruction

REG = 0x53  
TBLATH = 0xAA  
TBLATL = 0x55  
TBLPTR = 0xA356  
MEMORY(TBLPTR) = 0xFFFF

After Instruction (table write completion)

REG = 0x53  
TBLATH = 0x53  
TBLATL = 0x55  
TBLPTR = 0xA357  
MEMORY(TBLPTR - 1) = 0x5355

**Example 2:** TABLWT 0, 0, REG

Before Instruction

REG = 0x53  
TBLATH = 0xAA  
TBLATL = 0x55  
TBLPTR = 0xA356  
MEMORY(TBLPTR) = 0xFFFF

After Instruction (table write completion)

REG = 0x53  
TBLATH = 0xAA  
TBLATL = 0x53  
TBLPTR = 0xA356  
MEMORY(TBLPTR) = 0xAA53

## TLRD Table Latch Read

**Syntax:** [label] TLRD t,f

**Operands:**  $0 \leq f \leq 255$   
 $t \in [0,1]$

**Operation:** If  $t = 0$ ,  
TBLATL  $\rightarrow f$ ;  
If  $t = 1$ ,  
TBLATH  $\rightarrow f$

**Status Affected:** None

**Encoding:**

1010	00tx	ffff	ffff
------	------	------	------

**Description:** Read data from 16-bit table latch (TBLAT) into file register 'f'. Table Latch is unaffected.

If  $t = 1$ ; high byte is read

If  $t = 0$ ; low byte is read

This instruction is used in conjunction with TABLRD to transfer data from program memory to data memory.

**Words:** 1

**Cycles:** 1

**Q Cycle Activity:**

Q1	Q2	Q3	Q4
Decode	Read register TBLATH or TBLATL	Process Data	Write register 'f'

**Example:** TLRD t, RAM

Before Instruction

t = 0  
RAM = ?  
TBLAT = 0x00AF (TBLATH = 0x00)  
(TBLATL = 0xAF)

After Instruction

RAM = 0xAF  
TBLAT = 0x00AF (TBLATH = 0x00)  
(TBLATL = 0xAF)

Before Instruction

t = 1  
RAM = ?  
TBLAT = 0x00AF (TBLATH = 0x00)  
(TBLATL = 0xAF)

After Instruction

RAM = 0x00  
TBLAT = 0x00AF (TBLATH = 0x00)  
(TBLATL = 0xAF)

## 19.4 MPLINK Object Linker/ MPLIB Object Librarian

The MPLINK object linker combines relocatable objects created by the MPASM assembler and the MPLAB C17 and MPLAB C18 C compilers. It can also link relocatable objects from pre-compiled libraries, using directives from a linker script.

The MPLIB object librarian is a librarian for pre-compiled code to be used with the MPLINK object linker. When a routine from a library is called from another source file, only the modules that contain that routine will be linked in with the application. This allows large libraries to be used efficiently in many different applications. The MPLIB object librarian manages the creation and modification of library files.

The MPLINK object linker features include:

- Integration with MPASM assembler and MPLAB C17 and MPLAB C18 C compilers.
- Allows all memory areas to be defined as sections to provide link-time flexibility.

The MPLIB object librarian features include:

- Easier linking because single libraries can be included instead of many smaller files.
- Helps keep code maintainable by grouping related modules together.
- Allows libraries to be created and modules to be added, listed, replaced, deleted or extracted.

## 19.5 MPLAB SIM Software Simulator

The MPLAB SIM software simulator allows code development in a PC-hosted environment by simulating the PIC series microcontrollers on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a file, or user-defined key press, to any of the pins. The execution can be performed in single step, execute until break, or trace mode.

The MPLAB SIM simulator fully supports symbolic debugging using the MPLAB C17 and the MPLAB C18 C compilers and the MPASM assembler. The software simulator offers the flexibility to develop and debug code outside of the laboratory environment, making it an excellent multi-project software development tool.

## 19.6 MPLAB ICE High Performance Universal In-Circuit Emulator with MPLAB IDE

The MPLAB ICE universal in-circuit emulator is intended to provide the product development engineer with a complete microcontroller design tool set for PIC microcontrollers (MCUs). Software control of the MPLAB ICE in-circuit emulator is provided by the MPLAB Integrated Development Environment (IDE), which allows editing, building, downloading and source debugging from a single environment.

The MPLAB ICE 2000 is a full-featured emulator system with enhanced trace, trigger and data monitoring features. Interchangeable processor modules allow the system to be easily reconfigured for emulation of different processors. The universal architecture of the MPLAB ICE in-circuit emulator allows expansion to support new PIC microcontrollers.

The MPLAB ICE in-circuit emulator system has been designed as a real-time emulation system, with advanced features that are generally found on more expensive development tools. The PC platform and Microsoft® Windows environment were chosen to best make these features available to you, the end user.

## 19.7 ICEPIC In-Circuit Emulator

The ICEPIC low cost, in-circuit emulator is a solution for the Microchip Technology PIC16C5X, PIC16C6X, PIC16C7X and PIC16CXXX families of 8-bit One-Time-Programmable (OTP) microcontrollers. The modular system can support different subsets of PIC16C5X or PIC16CXXX products through the use of interchangeable personality modules, or daughter boards. The emulator is capable of emulating without target application circuitry being present.

## 22.0 PACKAGING INFORMATION

### 22.1 Package Marking Information

64-Lead TQFP

Example

68-Lead PLCC

Example

80-Lead TQFP

Example

<b>Legend:</b>	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

**Note:** In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

## 64-Lead Plastic Thin Quad Flatpack (PT) 10x10x1 mm Body, 1.0/0.10 mm Lead Form (TQFP)

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>
