

Welcome to [E-XFL.COM](https://www.e-xfl.com)

What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "[Embedded - Microcontrollers](#)"

Details

Product Status	Obsolete
Core Processor	PIC
Core Size	8-Bit
Speed	8MHz
Connectivity	I ² C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	66
Program Memory Size	32KB (16K x 16)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	902 x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 5.5V
Data Converters	A/D 16x10b
Oscillator Type	External
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	84-LCC (J-Lead)
Supplier Device Package	84-PLCC (29.31x29.31)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic17lc766t-08-l

PIC17C7XX

7.3 Stack Operation

PIC17C7XX devices have a 16 x 16-bit hardware stack (Figure 7-1). The stack is not part of either the program or data memory space, and the stack pointer is neither readable nor writable. The PC (Program Counter) is “PUSH’d” onto the stack when a `CALL` or `LCALL` instruction is executed, or an interrupt is acknowledged. The stack is “POP’d” in the event of a `RETURN`, `RETLW`, or a `RETFIE` instruction execution. `PCLATH` is not affected by a “PUSH” or a “POP” operation.

The stack operates as a circular buffer, with the stack pointer initialized to '0' after all RESETS. There is a stack available bit (STKAV) to allow software to ensure that the stack will not overflow. The STKAV bit is set after a device RESET. When the stack pointer equals Fh, STKAV is cleared. When the stack pointer rolls over from Fh to 0h, the STKAV bit will be held clear until a device RESET.

Note 1: There is not a status bit for stack underflow. The STKAV bit can be used to detect the underflow which results in the stack pointer being at the Top-of-Stack.

2: There are no instruction mnemonics called `PUSH` or `POP`. These are actions that occur from the execution of the `CALL`, `RETURN`, `RETLW` and `RETFIE` instructions, or the vectoring to an interrupt vector.

3: After a RESET, if a “POP” operation occurs before a “PUSH” operation, the STKAV bit will be cleared. This will appear as if the stack is full (underflow has occurred). If a “PUSH” operation occurs next (before another “POP”), the STKAV bit will be locked clear. Only a device RESET will cause this bit to set.

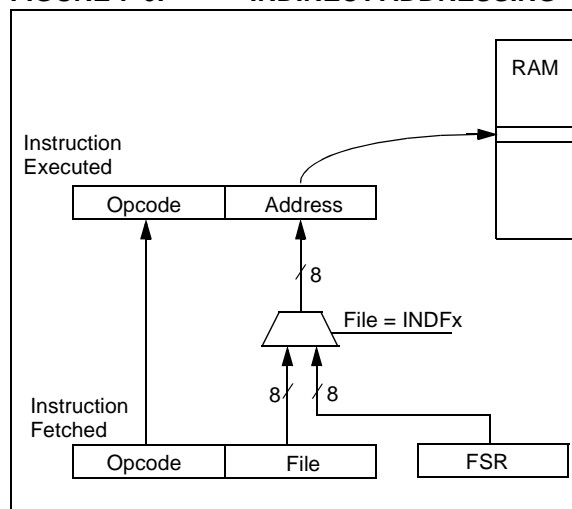

After the device is “PUSH’d” sixteen times (without a “POP”), the seventeenth push overwrites the value from the first push. The eighteenth push overwrites the second push (and so on).

7.4 Indirect Addressing

Indirect addressing is a mode of addressing data memory where the data memory address in the instruction is not fixed. That is, the register that is to be read or written can be modified by the program. This can be useful for data tables in the data memory. Figure 7-6 shows the operation of indirect addressing. This depicts the moving of the value to the data memory address specified by the value of the FSR register.

Example 7-1 shows the use of indirect addressing to clear RAM in a minimum number of instructions. A similar concept could be used to move a defined number of bytes (block) of data to the USART transmit register (TXREG). The starting address of the block of data to be transmitted could easily be modified by the program.

FIGURE 7-6: INDIRECT ADDRESSING

7.4.1 INDIRECT ADDRESSING REGISTERS

The PIC17C7XX has four registers for indirect addressing. These registers are:

- INDF0 and FSR0
- INDF1 and FSR1

Registers INDF0 and INDF1 are not physically implemented. Reading or writing to these registers activates indirect addressing, with the value in the corresponding FSR register being the address of the data. The FSR is an 8-bit register and allows addressing anywhere in the 256-byte data memory address range. For banked memory, the bank of memory accessed is specified by the value in the BSR.

If file INDF0 (or INDF1) itself is read indirectly via an FSR, all '0's are read (Zero bit is set). Similarly, if INDF0 (or INDF1) is written to indirectly, the operation will be equivalent to a `NOP`, and the status bits are not affected.

Example 9-4 shows the sequence to do a 16 x 16 signed multiply. Equation 9-2 shows the algorithm used. The 32-bit result is stored in four registers, RES3:RES0. To account for the sign bits of the arguments, each argument pairs most significant bit (MSb) is tested and the appropriate subtractions are done.

EQUATION 9-2: 16 x 16 SIGNED MULTIPLICATION ALGORITHM

$$\begin{aligned}
 &RES3:RES0 \\
 &= ARG1H:ARG1L \bullet ARG2H:ARG2L \\
 &= (ARG1H \bullet ARG2H \bullet 2^{16}) \quad + \\
 &\quad (ARG1H \bullet ARG2L \bullet 2^8) \quad + \\
 &\quad (ARG1L \bullet ARG2H \bullet 2^8) \quad + \\
 &\quad (ARG1L \bullet ARG2L) \quad + \\
 &\quad (-1 \bullet ARG2H<7> \bullet ARG1H:ARG1L \bullet 2^{16}) \quad + \\
 &\quad (-1 \bullet ARG1H<7> \bullet ARG2H:ARG2L \bullet 2^{16})
 \end{aligned}$$

PIC17C7XX

10.1 PORTA Register

PORTA is a 6-bit wide latch. PORTA does not have a corresponding Data Direction Register (DDR). Upon a device RESET, the PORTA pins are forced to be hi-impedance inputs. For the RA4 and RA5 pins, the peripheral module controls the output. When a device RESET occurs, the peripheral module is disabled, so these pins are forced to be hi-impedance inputs.

Reading PORTA reads the status of the pins.

The RA0 pin is multiplexed with the external interrupt, INT. The RA1 pin is multiplexed with TMR0 clock input, RA2 and RA3 are multiplexed with the SSP functions, and RA4 and RA5 are multiplexed with the USART1 functions. The control of RA2, RA3, RA4 and RA5 as outputs, is automatically configured by their multiplexed peripheral module when the module is enabled.

10.1.1 USING RA2, RA3 AS OUTPUTS

The RA2 and RA3 pins are open drain outputs. To use the RA2 and/or the RA3 pin(s) as output(s), simply write to the PORTA register the desired value. A '0' will cause the pin to drive low, while a '1' will cause the pin to float (hi-impedance). An external pull-up resistor should be used to pull the pin high. Writes to the RA2 and RA3 pins will not affect the other PORTA pins.

Note: When using the RA2 or RA3 pin(s) as output(s), read-modify-write instructions (such as BCF, BSF, BTG) on PORTA are not recommended.

Such operations read the port pins, do the desired operation, and then write this value to the data latch. This may inadvertently cause the RA2 or RA3 pins to switch from input to output (or vice-versa).

To avoid this possibility, use a shadow register for PORTA. Do the bit operations on this shadow register and then move it to PORTA.

Example 10-1 shows an instruction sequence to initialize PORTA. The Bank Select Register (BSR) must be selected to Bank 0 for the port to be initialized. The following example uses the MOVLB instruction to load the BSR register for bank selection.

EXAMPLE 10-1: INITIALIZING PORTA

```
MOVLB 0      ; Select Bank 0
MOVLW 0xF3   ;
MOVWF PORTA  ; Initialize PORTA
              ; RA<3:2> are output low
              ; RA<5:4> and RA<1:0>
              ; are inputs
              ; (outputs floating)
```

FIGURE 10-1: RA0 AND RA1 BLOCK DIAGRAM

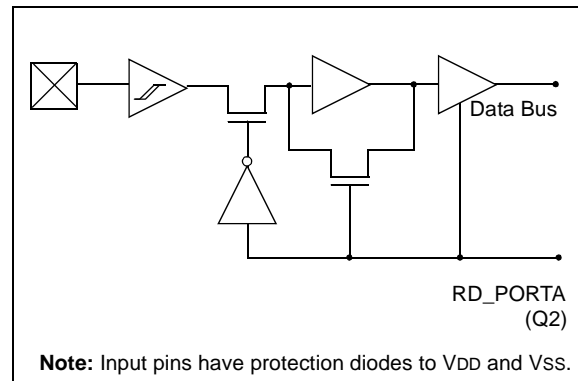

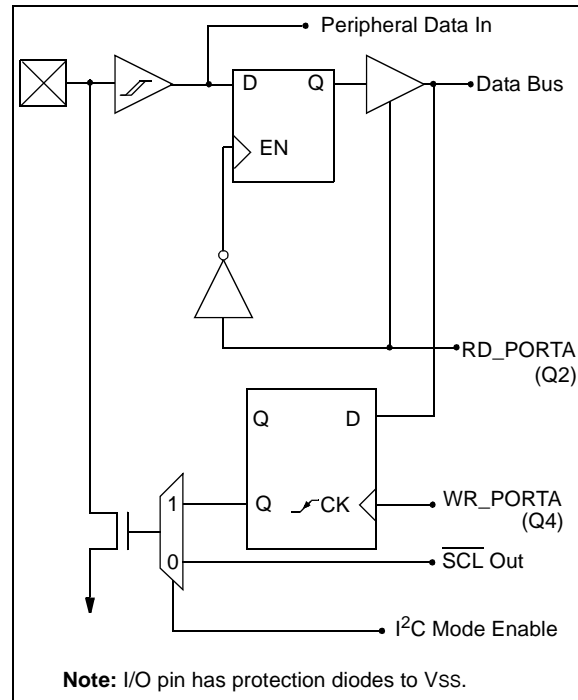

FIGURE 10-2: RA2 BLOCK DIAGRAM

13.1.3.1 PWM Periods

The period of the PWM1 output is determined by Timer1 and its period register (PR1). The period of the PWM2 and PWM3 outputs can be individually software configured to use either Timer1 or Timer2 as the time-base. For PWM2, when TM2PW2 bit (PW2DCL<5>) is clear, the time base is determined by TMR1 and PR1 and when TM2PW2 is set, the time base is determined by Timer2 and PR2. For PWM3, when TM2PW3 bit (PW3DCL<5>) is clear, the time base is determined by TMR1 and PR1, and when TM2PW3 is set, the time base is determined by Timer2 and PR2.

Running two different PWM outputs on two different timers allows different PWM periods. Running all PWMs from Timer1 allows the best use of resources by freeing Timer2 to operate as an 8-bit timer. Timer1 and Timer2 cannot be used as a 16-bit timer if any PWM is being used.

The PWM periods can be calculated as follows:

$$\text{period of PWM1} = [(PR1) + 1] \times 4T_{OSC}$$

$$\text{period of PWM2} = [(PR1) + 1] \times 4T_{OSC} \quad \text{or} \quad [(PR2) + 1] \times 4T_{OSC}$$

$$\text{period of PWM3} = [(PR1) + 1] \times 4T_{OSC} \quad \text{or} \quad [(PR2) + 1] \times 4T_{OSC}$$

The duty cycle of PWMx is determined by the 10-bit value DCx<9:0>. The upper 8-bits are from register PWxDCH and the lower 2-bits are from PWxDCL<7:6> (PWxDCH:PWxDCL<7:6>). Table 13-4 shows the maximum PWM frequency (FPWM), given the value in the period register.

The number of bits of resolution that the PWM can achieve depends on the operation frequency of the device as well as the PWM frequency (FPWM).

Maximum PWM resolution (bits) for a given PWM frequency:

$$= \frac{\log \left(\frac{F_{OSC}}{F_{PWM}} \right)}{\log (2)} \quad \text{bits}$$

where: $F_{PWM} = 1 / \text{period of PWM}$

The PWMx duty cycle is as follows:

$$\text{PWMx Duty Cycle} = (DCx) \times T_{OSC}$$

where DCx represents the 10-bit value from PWxDCH:PWxDCL.

If DCx = 0, then the duty cycle is zero. If PRx = PWxDCH, then the PWM output will be low for one to four Q-clocks (depending on the state of the PWxDCL<7:6> bits). For a duty cycle to be 100%, the PWxDCH value must be greater than the PRx value.

The duty cycle registers for both PWM outputs are double buffered. When the user writes to these registers, they are stored in master latches. When TMR1 (or TMR2) overflows and a new PWM period begins, the master latch values are transferred to the slave latches and the PWMx pin is forced high.

Note: For PW1DCH, PW1DCL, PW2DCH, PW2DCL, PW3DCH and PW3DCL registers, a write operation writes to the "master latches", while a read operation reads the "slave latches". As a result, the user may not read back what was just written to the duty cycle registers (until transferred to slave latch).

The user should also avoid any "read-modify-write" operations on the duty cycle registers, such as: ADDWF PW1DCH. This may cause duty cycle outputs that are unpredictable.

TABLE 13-4: PWM FREQUENCY vs. RESOLUTION AT 33 MHz

PWM Frequency	Frequency (kHz)				
	32.2	64.5	90.66	128.9	515.6
PRx Value	0xFF	0x7F	0x5A	0x3F	0x0F
High Resolution	10-bit	9-bit	8.5-bit	8-bit	6-bit
Standard Resolution	8-bit	7-bit	6.5-bit	6-bit	4-bit

13.1.3.2 PWM INTERRUPTS

The PWM modules make use of the TMR1 and/or TMR2 interrupts. A timer interrupt is generated when TMR1 or TMR2 equals its period register and on the following increment is cleared to zero. This interrupt also marks the beginning of a PWM cycle. The user can write new duty cycle values before the timer rollover. The TMR1 interrupt is latched into the TMR1IF bit and the TMR2 interrupt is latched into the TMR2IF bit. These flags must be cleared in software.

13.2.3 READING THE CAPTURE REGISTERS

The Capture overflow status flag bits are double buffered. The master bit is set if one captured word is already residing in the Capture register and another “event” has occurred on the CAPx pin. The new event will not transfer the TMR3 value to the capture register, protecting the previous unread capture value. When the user reads both the high and the low bytes (in any

order) of the Capture register, the master overflow bit is transferred to the slave overflow bit (CAxOVF) and then the master bit is reset. The user can then read TCONx to determine the value of CAxOVF.

An example of an instruction sequence to read capture registers and capture overflow flag bits is shown in Example 13-1. Depending on the capture source, different registers will need to be read.

EXAMPLE 13-1: SEQUENCE TO READ CAPTURE REGISTERS

```
MOVLB 3           ; Select Bank 3
MOVFPF CA2L, LO_BYTE ; Read Capture2 low byte, store in LO_BYTE
MOVFPF CA2H, HI_BYTE ; Read Capture2 high byte, store in HI_BYTE
MOVFPF TCON2, STAT_VAL ; Read TCON2 into file STAT_VAL
```

Legend: x = unknown, u = unchanged, - = unimplemented, read as '0', q = value depends on condition.
Shaded cells are not used by Capture.

14.2 USART Asynchronous Mode

In this mode, the USART uses standard nonreturn-to-zero (NRZ) format (one START bit, eight or nine data bits, and one STOP bit). The most common data format is 8-bits. An on-chip dedicated 8-bit baud rate generator can be used to derive standard baud rate frequencies from the oscillator. The USART's transmitter and receiver are functionally independent but use the same data format and baud rate. The baud rate generator produces a clock x64 of the bit shift rate. Parity is not supported by the hardware, but can be implemented in software (and stored as the ninth data bit). Asynchronous mode is stopped during SLEEP.

The Asynchronous mode is selected by clearing the SYNC bit (TXSTA<4>).

The USART Asynchronous module consists of the following components:

- Baud Rate Generator
- Sampling Circuit
- Asynchronous Transmitter
- Asynchronous Receiver

14.2.1 USART ASYNCHRONOUS TRANSMITTER

The USART transmitter block diagram is shown in Figure 14-1. The heart of the transmitter is the transmit shift register (TSR). The shift register obtains its data from the read/write transmit buffer (TXREG). TXREG is loaded with data in software. The TSR is not loaded until the STOP bit has been transmitted from the previous load. As soon as the STOP bit is transmitted, the TSR is loaded with new data from the TXREG (if available). Once TXREG transfers the data to the TSR (occurs in one Tcy at the end of the current BRG cycle), the TXREG is empty and an interrupt bit, TXIF, is set. This interrupt can be enabled/disabled by setting/clearing the TXIE bit. TXIF will be set, regardless of TXIE and cannot be reset in software. It will reset only when new data is loaded into TXREG. While TXIF indicates the status of the TXREG, the TRMT (TXSTA<1>) bit shows the status of the TSR.

TRMT is a read only bit which is set when the TSR is empty. No interrupt logic is tied to this bit, so the user has to poll this bit in order to determine if the TSR is empty.

Note: The TSR is not mapped in data memory, so it is not available to the user.

Transmission is enabled by setting the TXEN (TXSTA<5>) bit. The actual transmission will not occur until TXREG has been loaded with data and the baud rate generator (BRG) has produced a shift clock (Figure 14-3). The transmission can also be started by first loading TXREG and then setting TXEN. Normally, when transmission is first started, the TSR is empty, so a transfer to TXREG will result in an immediate transfer to TSR, resulting in an empty TXREG. A back-to-back transfer is thus possible (Figure 14-4). Clearing TXEN during a transmission will cause the transmission to be aborted. This will reset the transmitter and the TX/CK pin will revert to hi-impedance.

In order to select 9-bit transmission, the TX9 (TXSTA<6>) bit should be set and the ninth bit value should be written to TX9D (TXSTA<0>). The ninth bit value must be written before writing the 8-bit data to the TXREG. This is because a data write to TXREG can result in an immediate transfer of the data to the TSR (if the TSR is empty).

Steps to follow when setting up an Asynchronous Transmission:

1. Initialize the SPBRG register for the appropriate baud rate.
2. Enable the asynchronous serial port by clearing the SYNC bit and setting the SPEN bit.
3. If interrupts are desired, then set the TXIE bit.
4. If 9-bit transmission is desired, then set the TX9 bit.
5. If 9-bit transmission is selected, the ninth bit should be loaded in TX9D.
6. Load data to the TXREG register.
7. Enable the transmission by setting TXEN (starts transmission).

FIGURE 14-3: ASYNCHRONOUS MASTER TRANSMISSION

PIC17C7XX

15.4 Example Program

Example 15-2 shows MPLAB® C17 'C' code for using the I²C module in Master mode to communicate with a 24LC01B serial EEPROM. This example uses the PIC® MCU 'C' libraries included with MPLAB C17.

EXAMPLE 15-2: INTERFACING TO A 24LC01B SERIAL EEPROM (USING MPLAB C17)

```
// Include necessary header files
#include <p17c756.h>      // Processor header file
#include <delays.h>       // Delay routines header file
#include <stdlib.h>       // Standard Library header file
#include <i2c16.h>        // I2C routines header file

#define CONTROL 0xa0     // Control byte definition for 24LC01B

// Function declarations
void main(void);
void WritePORTD(static unsigned char data);
void ByteWrite(static unsigned char address,static unsigned char data);
unsigned char ByteRead(static unsigned char address);
void ACKPoll(void);

// Main program
void main(void)
{
    static unsigned char address;    // I2C address of 24LC01B
    static unsigned char dataao;     // Data written to 24LC01B
    static unsigned char dataai;     // Data read from 24LC01B

    address = 0;                    // Preset address to 0
    OpenI2C(MASTER,SLEW_ON);        // Configure I2C Module Master mode, Slew rate control on
    SSPADD = 39;                    // Configure clock for 100KHz

    while(address<128)              // Loop 128 times, 24LC01B is 128x8
    {
        dataao = PORTB;
        do
        {
            ByteWrite(address,dataao); // Write data to EEPROM
            ACKPoll();                 // Poll the 24LC01B for state
            dataai = ByteRead(address); // Read data from EEPROM into SSPBUF
        } while(dataai != dataao);     // Loop as long as data not correctly
                                        // written to 24LC01B

        address++;                    // Increment address
    }
    while(1)                        // Done writing 128 bytes to 24LC01B, Loop forever
    {
        Nop();
    }
}
```

PIC17C7XX

Table 18-2 lists the instructions recognized by the MPASM assembler.

Note 1: Any unused opcode is Reserved. Use of any reserved opcode may cause unexpected operation.

All instruction examples use the following format to represent a hexadecimal number:

0xhh

where h signifies a hexadecimal digit.

To represent a binary number:

0000 0100b

where b signifies a binary string.

FIGURE 18-1: GENERAL FORMAT FOR INSTRUCTIONS

18.1 Special Function Registers as Source/Destination

The PIC17C7XX's orthogonal instruction set allows read and write of all file registers, including special function registers. There are some special situations the user should be aware of:

18.1.1 ALUSTA AS DESTINATION

If an instruction writes to ALUSTA, the Z, C, DC and OV bits may be set or cleared as a result of the instruction and overwrite the original data bits written. For example, executing `CLRF ALUSTA` will clear register ALUSTA and then set the Z bit leaving 0000 0100b in the register.

18.1.2 PCL AS SOURCE OR DESTINATION

Read, write or read-modify-write on PCL may have the following results:

Read PC: PCH → PCLATH; PCL → dest

Write PCL: PCLATH → PCH;
8-bit destination value → PCL

Read-Modify-Write: PCL → ALU operand
PCLATH → PCH;
8-bit result → PCL

Where PCH = program counter high byte (not an addressable register), PCLATH = Program counter high holding latch, dest = destination, WREG or f.

18.1.3 BIT MANIPULATION

All bit manipulation instructions are done by first reading the entire register, operating on the selected bit and writing the result back (read-modify-write (R-M-W)). The user should keep this in mind when operating on some special function registers, such as ports.

Note: Status bits that are manipulated by the device (including the interrupt flag bits) are set or cleared in the Q1 cycle. So, there is no issue on doing R-M-W instructions on registers which contain these bits

DECF	Decrement f								
Syntax:	[<i>label</i>] DECF f,d								
Operands:	$0 \leq f \leq 255$ $d \in [0,1]$								
Operation:	$(f) - 1 \rightarrow (\text{dest})$								
Status Affected:	OV, C, DC, Z								
Encoding:	<table><tr><td>0000</td><td>011d</td><td>ffff</td><td>ffff</td></tr></table>	0000	011d	ffff	ffff				
0000	011d	ffff	ffff						
Description:	Decrement register 'f'. If 'd' is 0, the result is stored in WREG. If 'd' is 1, the result is stored back in register 'f'.								
Words:	1								
Cycles:	1								
Q Cycle Activity:	<table><tr><th>Q1</th><th>Q2</th><th>Q3</th><th>Q4</th></tr><tr><td>Decode</td><td>Read register 'f'</td><td>Process Data</td><td>Write to destination</td></tr></table>	Q1	Q2	Q3	Q4	Decode	Read register 'f'	Process Data	Write to destination
Q1	Q2	Q3	Q4						
Decode	Read register 'f'	Process Data	Write to destination						

Example: DECF CNT, 1

Before Instruction

CNT = 0x01
Z = 0

After Instruction

CNT = 0x00
Z = 1

DECFSZ		Decrement f, skip if 0							
Syntax:	[<i>label</i>] DECFSZ f,d								
Operands:	$0 \leq f \leq 255$ $d \in [0,1]$								
Operation:	$(f) - 1 \rightarrow (\text{dest});$ skip if result = 0								
Status Affected:	None								
Encoding:	<table border="1"><tr><td>0001</td><td>011d</td><td>ffff</td><td>ffff</td></tr></table>					0001	011d	ffff	ffff
0001	011d	ffff	ffff						
Description:	<p>The contents of register 'f' are decremented. If 'd' is 0, the result is placed in WREG. If 'd' is 1, the result is placed back in register 'f'.</p> <p>If the result is 0, the next instruction, which is already fetched is discarded and a NOP is executed instead, making it a two-cycle instruction.</p>								
Words:	1								
Cycles:	1(2)								

If skip:

Q1	Q2	Q3	Q4
No operation	No operation	No operation	No operation

Example: HERE DECFSZ CNT, 1
 GOTO HERE

 NZERO
 ZERO

Before Instruction

PC = Address (HERE)

After Instruction

CNT = CNT - 1
If CNT = 0;
 PC = Address (HERE)
If CNT \neq 0;
 PC = Address (NZERO)

Move Literal to high nibble in BSR									
MOVLW									
Syntax:	[<i>label</i>] MOVLW k								
Operands:	$0 \leq k \leq 15$								
Operation:	$k \rightarrow (\text{BSR} \langle 7:4 \rangle)$								
Status Affected:	None								
Encoding:	<table><tr><td>1011</td><td>101x</td><td>kkkk</td><td>uuuu</td></tr></table>	1011	101x	kkkk	uuuu				
1011	101x	kkkk	uuuu						
Description:	The 4-bit literal 'k' is loaded into the most significant 4-bits of the Bank Select Register (BSR). Only the high 4-bits of the Bank Select Register are affected. The lower half of the BSR is unchanged. The assembler will encode the "u" fields as 0.								
Words:	1								
Cycles:	1								
Q Cycle Activity:	<table><tr><td>Q1</td><td>Q2</td><td>Q3</td><td>Q4</td></tr><tr><td>Decode</td><td>Read literal 'k'</td><td>Process Data</td><td>Write literal 'k' to BSR<7:4></td></tr></table>	Q1	Q2	Q3	Q4	Decode	Read literal 'k'	Process Data	Write literal 'k' to BSR<7:4>
Q1	Q2	Q3	Q4						
Decode	Read literal 'k'	Process Data	Write literal 'k' to BSR<7:4>						

Example: MOVLW 5

Before Instruction
BSR register = 0x22

After Instruction
BSR register = 0x52

MOVLW		Move Literal to WREG						
Syntax:	[<i>label</i>] MOVLW k							
Operands:	$0 \leq k \leq 255$							
Operation:	$k \rightarrow (\text{WREG})$							
Status Affected:	None							
Encoding:	<table border="1"><tr><td>1011</td><td>0000</td><td>kkkk</td><td>kkkk</td></tr></table>				1011	0000	kkkk	kkkk
1011	0000	kkkk	kkkk					
Description:	The eight-bit literal 'k' is loaded into WREG.							
Words:	1							
Cycles:	1							
Q Cycle Activity:								
	Q1	Q2	Q3	Q4				
	Decode	Read literal 'k'	Process Data	Write to WREG				

Example: MOVLW 0x5A

After Instruction
WREG = 0x5A

19.0 DEVELOPMENT SUPPORT

The PIC® microcontrollers are supported with a full range of hardware and software development tools:

- Integrated Development Environment
 - MPLAB® IDE Software
- Assemblers/Compilers/Linkers
 - MPASM™ Assembler
 - MPLAB C17 and MPLAB C18 C Compilers
 - MPLINK™ Object Linker/
MPLIB™ Object Librarian
- Simulators
 - MPLAB SIM Software Simulator
- Emulators
 - MPLAB ICE 2000 In-Circuit Emulator
 - ICEPIC™ In-Circuit Emulator
- In-Circuit Debugger
 - MPLAB ICD for PIC16F87X
- Device Programmers
 - PRO MATE® II Universal Device Programmer
 - PICSTART® Plus Entry-Level Development Programmer
- Low Cost Demonstration Boards
 - PICDEM™ 1 Demonstration Board
 - PICDEM 2 Demonstration Board
 - PICDEM 3 Demonstration Board
 - PICDEM 17 Demonstration Board
 - KEELOQ® Demonstration Board

19.1 MPLAB Integrated Development Environment Software

The MPLAB IDE software brings an ease of software development previously unseen in the 8-bit microcontroller market. The MPLAB IDE is a Windows®-based application that contains:

- An interface to debugging tools
 - simulator
 - programmer (sold separately)
 - emulator (sold separately)
 - in-circuit debugger (sold separately)
- A full-featured editor
- A project manager
- Customizable toolbar and key mapping
- A status bar
- On-line help

The MPLAB IDE allows you to:

- Edit your source files (either assembly or 'C')
- One touch assemble (or compile) and download to PIC MCU emulator and simulator tools (automatically updates all project information)
- Debug using:
 - source files
 - absolute listing file
 - machine code

The ability to use MPLAB IDE with multiple debugging tools allows users to easily switch from the cost-effective simulator to a full-featured emulator with minimal retraining.

19.2 MPASM Assembler

The MPASM assembler is a full-featured universal macro assembler for all PIC MCU's.

The MPASM assembler has a command line interface and a Windows shell. It can be used as a stand-alone application on a Windows 3.x or greater system, or it can be used through MPLAB IDE. The MPASM assembler generates relocatable object files for the MPLINK object linker, Intel® standard HEX files, MAP files to detail memory usage and symbol reference, an absolute LST file that contains source lines and generated machine code, and a COD file for debugging.

The MPASM assembler features include:

- Integration into MPLAB IDE projects.
- User-defined macros to streamline assembly code.
- Conditional assembly for multi-purpose source files.
- Directives that allow complete control over the assembly process.

19.3 MPLAB C17 and MPLAB C18 C Compilers

The MPLAB C17 and MPLAB C18 Code Development Systems are complete ANSI 'C' compilers for Microchip's PIC17CXXX and PIC18CXXX family of microcontrollers, respectively. These compilers provide powerful integration capabilities and ease of use not found with other compilers.

For easier source level debugging, the compilers provide symbol information that is compatible with the MPLAB IDE memory display.

PIC17C7XX

20.2 DC Characteristics: PIC17C7XX-16 (Commercial, Industrial, Extended) PIC17C7XX-33 (Commercial, Industrial, Extended) PIC17LC7XX-08 (Commercial, Industrial)

Standard Operating Conditions (unless otherwise stated)							
Operating temperature							
DC CHARACTERISTICS							
-40°C ≤ TA ≤ +125°C for extended							
-40°C ≤ TA ≤ +85°C for industrial							
0°C ≤ TA ≤ +70°C for commercial							
Operating voltage VDD range as described in Section 20.1							
Param. No.	Sym	Characteristic	Min	Typ†	Max	Units	Conditions
		Input Low Voltage					
D030	VIL	I/O ports					
		with TTL buffer (Note 6)	Vss	–	0.8	V	4.5V ≤ VDD ≤ 5.5V
			Vss	–	0.2VDD	V	3.0V ≤ VDD ≤ 4.5V
D031		with Schmitt Trigger buffer					
		RA2, RA3	Vss	–	0.3VDD	V	I²C compliant
		All others	Vss	–	0.2VDD	V	
D032		MCLR, OSC1 (in EC and RC mode)	Vss	–	0.2VDD	V	(Note 1)
D033		OSC1 (in XT, and LF mode)	–	0.5VDD	–	V	
		Input High Voltage					
D040	VIH	I/O ports					
		with TTL buffer (Note 6)	2.0	–	VDD	V	4.5V ≤ VDD ≤ 5.5V
			1 + 0.2VDD	–	VDD	V	3.0V ≤ VDD ≤ 4.5V
D041		with Schmitt Trigger buffer					
		RA2, RA3	0.7VDD	–	VDD	V	I²C compliant
		All others	0.8VDD	–	VDD	V	
D042		MCLR	0.8VDD	–	VDD	V	(Note 1)
D043		OSC1 (XT, and LF mode)	–	0.5VDD	–	V	
D050	VHYS	Hysteresis of Schmitt Trigger Inputs	0.15VDD	–	–	V	

† Data in "Typ" column is at 5V, 25°C unless otherwise stated.

Note 1: In RC oscillator configuration, the OSC1/CLKIN pin is a Schmitt Trigger input. It is not recommended that the PIC17CXXX devices be driven with external clock in RC mode.

2: The leakage current on the MCLR pin is strongly dependent on the applied voltage level. Higher leakage current may be measured at different input voltages.

3: Negative current is defined as current sourced by the pin.

4: These specifications are for the programming of the on-chip program memory EPROM through the use of the table write instructions. The complete programming specifications can be found in: PIC17C7XX Programming Specifications (Literature number DS TBD).

5: The MCLR/VPP pin may be kept in this range at times other than programming, but is not recommended.

6: For TTL buffers, the better of the two specifications may be used.

20.4 Timing Diagrams and Specifications

FIGURE 20-6: EXTERNAL CLOCK TIMING

TABLE 20-1: EXTERNAL CLOCK TIMING REQUIREMENTS

Param No.	Sym	Characteristic	Min	Typ†	Max	Units	Conditions
	FOSC	External CLKIN Frequency (Note 1)	DC	—	8	MHz	EC osc mode - 08 devices (8 MHz devices)
			DC	—	16	MHz	- 16 devices (16 MHz devices)
			DC	—	33	MHz	- 33 devices (33 MHz devices)
		Oscillator Frequency (Note 1)	DC	—	4	MHz	RC osc mode
			2	—	8	MHz	XT osc mode - 08 devices (8 MHz devices)
			2	—	16	MHz	- 16 devices (16 MHz devices)
			2	—	33	MHz	- 33 devices (33 MHz devices)
			DC	—	2	MHz	LF osc mode
1	TOSC	External CLKIN Period (Note 1)	125	—	—	ns	EC osc mode - 08 devices (8 MHz devices)
			62.5	—	—	ns	- 16 devices (16 MHz devices)
			30.3	—	—	ns	- 33 devices (33 MHz devices)
		Oscillator Period (Note 1)	250	—	—	ns	RC osc mode
			125	—	1,000	ns	XT osc mode - 08 devices (8 MHz devices)
			62.5	—	1,000	ns	- 16 devices (16 MHz devices)
			30.3	—	1,000	ns	- 33 devices (33 MHz devices)
			500	—	—	ns	LF osc mode
2	Tcy	Instruction Cycle Time (Note 1)	121.2	4/FOSC	DC	ns	
3	TosL, TosH	Clock in (OSC1) High or Low Time	10	—	—	ns	EC oscillator
4	TosR, TosF	Clock in (OSC1) Rise or Fall Time	—	—	5	ns	EC oscillator

† Data in "Typ" column is at 5V, 25°C unless otherwise stated.

Note 1: Instruction cycle period (Tcy) equals four times the input oscillator time base period. All specified values are based on characterization data for that particular oscillator type under standard operating conditions with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at "min." values with an external clock applied to the OSC1/CLKIN pin. When an external clock input is used, the "max." cycle time limit is "DC" (no clock) for all devices.

Examples: <div>a) PIC17C756 – 16L Commercial Temp., PLCC package, 16 MHz, normal VDD limits</div> <div>b) PIC17LC756–08/PT Commercial Temp., TQFP package, 8MHz, extended VDD limits</div> <div>c) PIC17C756–33I/PT Industrial Temp., TQFP package, 33 MHz, normal VDD limits</div>			

* JW Devices are UV erasable and can be programmed to any device configuration. JW Devices meet the electrical requirement of each oscillator type.

Sales and Support

Data Sheets

Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office
2. The Microchip Corporate Literature Center U.S. FAX: (480) 792-7277
3. The Microchip Worldwide Site (www.microchip.com)

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

New Customer Notification System
