

Welcome to [E-XFL.COM](#)

Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	1536
Total RAM Bits	18432
Number of I/O	71
Number of Gates	60000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 85°C (TA)
Package / Case	100-TQFP
Supplier Device Package	100-VQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/agl060v5-vqg100i

Figure 1-5 • I/O States During Programming Window

6. Click OK to return to the FlashPoint – Programming File Generator window.

Note: I/O States During programming are saved to the ADB and resulting programming files after completing programming file generation.

Table 2-3 • Flash Programming Limits – Retention, Storage, and Operating Temperature¹

Product Grade	Programming Cycles	Program Retention (biased/unbiased)	Maximum Storage Temperature T_{STG} (°C) ²	Maximum Operating Junction Temperature T_J (°C) ²
Commercial	500	20 years	110	100
Industrial	500	20 years	110	100

Notes:

1. This is a stress rating only; functional operation at any condition other than those indicated is not implied.
2. These limits apply for program/data retention only. Refer to Table 2-1 on page 2-1 and Table 2-2 on page 2-2 for device operating conditions and absolute limits.

Table 2-4 • Overshoot and Undershoot Limits¹

VCCI	Average VCCI–GND Overshoot or Undershoot Duration as a Percentage of Clock Cycle ²	Maximum Overshoot/ Undershoot ²
2.7 V or less	10%	1.4 V
	5%	1.49 V
3 V	10%	1.1 V
	5%	1.19 V
3.3 V	10%	0.79 V
	5%	0.88 V
3.6 V	10%	0.45 V
	5%	0.54 V

Notes:

1. Based on reliability requirements at junction temperature at 85°C.
2. The duration is allowed at one out of six clock cycles. If the overshoot/undershoot occurs at one out of two cycles, the maximum overshoot/undershoot has to be reduced by 0.15 V.
3. This table does not provide PCI overshoot/undershoot limits.

I/O Power-Up and Supply Voltage Thresholds for Power-On Reset (Commercial and Industrial)

Sophisticated power-up management circuitry is designed into every IGLOO device. These circuits ensure easy transition from the powered-off state to the powered-up state of the device. The many different supplies can power up in any sequence with minimized current spikes or surges. In addition, the I/O will be in a known state through the power-up sequence. The basic principle is shown in Figure 2-1 on page 2-4 and Figure 2-2 on page 2-5.

There are five regions to consider during power-up.

IGLOO I/Os are activated only if ALL of the following three conditions are met:

1. VCC and VCCI are above the minimum specified trip points (Figure 2-1 on page 2-4 and Figure 2-2 on page 2-5).
2. $VCCI > VCC - 0.75$ V (typical)
3. Chip is in the operating mode.

VCCI Trip Point:

Ramping up (V5 devices): $0.6 \text{ V} < \text{trip_point_up} < 1.2 \text{ V}$

Ramping down (V5 Devices): $0.5 \text{ V} < \text{trip_point_down} < 1.1 \text{ V}$

Ramping up (V2 devices): $0.75 \text{ V} < \text{trip_point_up} < 1.05 \text{ V}$

Ramping down (V2 devices): $0.65 \text{ V} < \text{trip_point_down} < 0.95 \text{ V}$

VCC Trip Point:

Ramping up (V5 devices): $0.6 \text{ V} < \text{trip_point_up} < 1.1 \text{ V}$

Ramping down (V5 devices): $0.5 \text{ V} < \text{trip_point_down} < 1.0 \text{ V}$

Power Consumption of Various Internal Resources

Table 2-19 • Different Components Contributing to Dynamic Power Consumption in IGLOO Devices For IGLOO V2 or V5 Devices, 1.5 V DC Core Supply Voltage

Parameter	Definition	Device Specific Dynamic Power ($\mu\text{W}/\text{MHz}$)							
		AGL1000	AGL600	AGL400	AGL250	AGL125	AGL060	AGL030	AGL015
PAC1	Clock contribution of a Global Rib	7.778	6.221	6.082	4.460	4.446	2.736	0.000	0.000
PAC2	Clock contribution of a Global Spine	4.334	3.512	2.759	2.718	1.753	1.971	3.483	3.483
PAC3	Clock contribution of a VersaTile row	1.379	1.445	1.377	1.483	1.467	1.503	1.472	1.472
PAC4	Clock contribution of a VersaTile used as a sequential module	0.151	0.149	0.151	0.149	0.149	0.151	0.146	0.146
PAC5	First contribution of a VersaTile used as a sequential module	0.057							
PAC6	Second contribution of a VersaTile used as a sequential module	0.207							
PAC7	Contribution of a VersaTile used as a combinatorial module	0.276	0.262	0.279	0.277	0.280	0.300	0.281	0.273
PAC8	Average contribution of a routing net	1.161	1.147	1.193	1.273	1.076	1.088	1.134	1.153
PAC9	Contribution of an I/O input pin (standard-dependent)	See Table 2-13 on page 2-10 through Table 2-15 on page 2-11.							
PAC10	Contribution of an I/O output pin (standard-dependent)	See Table 2-16 on page 2-11 through Table 2-18 on page 2-12.							
PAC11	Average contribution of a RAM block during a read operation	25.00							
PAC12	Average contribution of a RAM block during a write operation	30.00							
PAC13	Dynamic PLL contribution	2.70							

Note: For a different output load, drive strength, or slew rate, Microsemi recommends using the Microsemi power spreadsheet calculator or SmartPower tool in Libero SoC.

**Table 2-21 • Different Components Contributing to Dynamic Power Consumption in IGLOO Devices
For IGLOO V2 Devices, 1.2 V DC Core Supply Voltage**

Parameter	Definition	Device Specific Dynamic Power (μ W/MHz)							
		AGL1000	AGL600	AGL400	AGL250	AGL125	AGL060	AGL030	AGL015
PAC1	Clock contribution of a Global Rib	4.978	3.982	3.892	2.854	2.845	1.751	0.000	0.000
PAC2	Clock contribution of a Global Spine	2.773	2.248	1.765	1.740	1.122	1.261	2.229	2.229
PAC3	Clock contribution of a VersaTile row	0.883	0.924	0.881	0.949	0.939	0.962	0.942	0.942

Notes:

1. For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.
2. Software default selection highlighted in gray.
3. The minimum drive strength for any LVCMOS 3.3 V software configuration when run in wide range is $\pm 100 \mu\text{A}$. Drive strengths displayed in software are supported for normal range only. For a detailed I/V curve, refer to the IBIS models.

1.8 V LVCMOS

Low-voltage CMOS for 1.8 V is an extension of the LVCMOS standard (JESD8-5) used for general-purpose 1.8 V applications. It uses a 1.8 V input buffer and a push-pull output buffer.

**Table 2-95 • Minimum and Maximum DC Input and Output Levels
Applicable to Advanced I/O Banks**

1.8 V LVCMOS	VIL		VIH		VOL	VOH	IOL	IOH	IOSH	IOSL	IIL ¹	IIH ²
Drive Strength	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA	Max. mA ³	Max. mA ³	µA ⁴	µA ⁴

F_{MAX}	Maximum Frequency for FIFO	160	MHz

Note: For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.

3 – Pin Descriptions

Supply Pins

GND	Ground
Ground supply voltage to the core, I/O outputs, and I/O logic.	
GNDQ	Ground (quiet)
Quiet ground supply voltage to input buffers of I/O banks. Within the package, the GNDQ plane is decoupled from the simultaneous switching noise originated from the output buffer ground domain. This minimizes the noise transfer within the package and improves input signal integrity. GNDQ must always be connected to GND on the board.	
VCC	Core Supply Voltage
Supply voltage to the FPGA core, nominally 1.5 V for IGLOO V5 devices, and 1.2 V or 1.5 V for IGLOO V2 devices. VCC is required for powering the JTAG state machine in addition to VJTAG. Even when a device is in bypass mode in a JTAG chain of interconnected devices, both VCC and VJTAG must remain powered to allow JTAG signals to pass through the device.	
For IGLOO V2 devices, VCC can be switched dynamically from 1.2 V to 1.5 V or vice versa. This allows in-system programming (ISP) when VCC is at 1.5 V and the benefit of low power operation when VCC is at 1.2 V.	
VCCI_{Bx}	I/O Supply Voltage
Supply voltage to the bank's I/O output buffers and I/O logic. Bx is the I/O bank number. There are up to eight I/O banks on IGLOO devices plus a dedicated VJTAG bank. Each bank can have a separate VCCI connection. All I/Os in a bank will run off the same VCCI _{Bx} supply. VCCI can be 1.2 V, 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VCCI pins tied to GND.	
VMV_x	I/O Supply Voltage (quiet)
Quiet supply voltage to the input buffers of each I/O bank. x is the bank number. Within the package, the VMV plane biases the input stage of the I/Os in the I/O banks. This minimizes the noise transfer within the package and improves input signal integrity. Each bank must have at least one VMV connection, and no VMV should be left unconnected. All I/Os in a bank run off the same VMV _x supply. VMV is used to provide a quiet supply voltage to the input buffers of each I/O bank. VMV _x can be 1.2 V, 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VMV pins tied to GND. VMV and VCCI should be at the same voltage within a given I/O bank. Used VMV pins must be connected to the corresponding VCCI pins of the same bank (i.e., VMV0 to VCCI _{B0} , VMV1 to VCCI _{B1} , etc.).	
VCCPLA/B/C/D/E/F	PLL Supply Voltage
Supply voltage to analog PLL, nominally 1.5 V or 1.2 V.	
<ul style="list-style-type: none">• 1.5 V for IGLOO V5 devices• 1.2 V or 1.5 V for IGLOO V2 devices	
When the PLLs are not used, the Microsemi Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground. Microsemi recommends tying VCCPLx to VCC and using proper filtering circuits to decouple VCC noise from the PLLs. Refer to the PLL Power Supply Decoupling section of the "Clock Conditioning Circuits in Low Power Flash Devices and Mixed Signal FPGAs" chapter of the <i>IGLOO FPGA Fabric User Guide</i> for a complete board solution for the PLL analog power supply and ground.	
<ul style="list-style-type: none">• There is one VCCPLF pin on IGLOO devices.	
VCOMPLA/B/C/D/E/F	PLL Ground
Ground to analog PLL power supplies. When the PLLs are not used, the Microsemi Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground.	
There is one VCOMPLF pin on IGLOO devices.	

Pin Descriptions

Note that to operate at all VJTAG voltages, 500 Ω to 1 k Ω will satisfy the requirements.

Special Function Pins

NC

No Connect

This pin is not connected to circuitry within the device. These pins can be driven to any voltage or can be left floating with no effect on the operation of the device.

DC

Do Not Connect

This pin should not be connected to any signals on the PCB. These pins should be left unconnected.

Packaging

Semiconductor technology is constantly shrinking in size while growing in capability and functional integration. To enable next-generation silicon technologies, semiconductor packages have also evolved to provide improved performance and flexibility.

Microsemi consistently delivers packages that provide the necessary mechanical and environmental protection to ensure consistent reliability and performance. Microsemi IC packaging technology efficiently supports high-density FPGAs with large-pin-count Ball Grid Arrays (BGAs), but is also flexible enough to accommodate stringent form factor requirements for Chip Scale Packaging (CSP). In addition, Microsemi offers a variety of packages designed to meet your most demanding application and economic requirements for today's embedded and mobile systems.
