### Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### Details

|                                |                                                                                                                                                                     |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Notes:

1. AGL015 is not recommended for new designs.

2. Package not available.

C = Commercial temperature range: 0°C to 85°C junction temperature.

I = Industrial temperature range: –40°C to 100°C junction temperature.

## IGLOO Device Status

| IGLOO Devices | Status                           | M1 IGLOO Devices | Status     |
|---------------|----------------------------------|------------------|------------|
| AGL015        | Not recommended for new designs. |                  |            |
| AGL030        | Production                       |                  |            |
| AGL060        | Production                       |                  |            |
| AGL125        | Production                       |                  |            |
| AGL250        | Production                       | M1AGL250         | Production |
| AGL400        | Production                       |                  |            |
| AGL600        | Production                       | M1AGL600         | Production |
| AGL1000       | Production                       | M1AGL1000        | Production |

References made to IGLOO devices also apply to ARM-enabled IGLOOe devices. The ARM-enabled part numbers start with M1 (Cortex-M1).

### AGL015 and AGL030

The AGL015 and AGL030 are architecturally compatible; there are no RAM or PLL features.

## Devices Not Recommended For New Designs

AGL015 is not recommended for new designs.

**Table 2-39 • I/O Output Buffer Maximum Resistances<sup>1</sup>**  
**Applicable to Standard Plus I/O Banks**

| Standard                             | Drive Strength              | $R_{PULL-DOWN}$<br>( $\Omega$ ) <sup>2</sup> | $R_{PULL-UP}$<br>( $\Omega$ ) <sup>3</sup> |
|--------------------------------------|-----------------------------|----------------------------------------------|--------------------------------------------|
| 3.3 V LVTTTL / 3.3 V LVCMOS          | 2 mA                        | 100                                          | 300                                        |
|                                      | 4 mA                        | 100                                          | 300                                        |
|                                      | 6 mA                        | 50                                           | 150                                        |

| 3.3 V PCI/PCI-X                      | Per PCI/PCI-X specification | 25                                           | 75                                         |

Notes:

1. These maximum values are provided for informational reasons only. Minimum output buffer resistance values depend on VCCI, drive strength selection, temperature, and process. For board design considerations and detailed output buffer resistances, use the corresponding IBIS models located at <http://www.microsemi.com/soc/download/ibis/default.aspx>.
2.  $R_{(PULL-DOWN-MAX)} = (VOL_{spec}) / I_{OL_{spec}}$
3.  $R_{(PULL-UP-MAX)} = (VCCI_{max} - VOH_{spec}) / I_{OH_{spec}}$
4. Applicable to IGLOO V2 Devices operating at  $VCCI \geq VCC$

**Table 2-64 • Minimum and Maximum DC Input and Output Levels for LVC MOS 3.3 V Wide Range**  
**Applicable to Standard Plus I/O Banks**

| 3.3 V LVC MOS Wide Range |                                                                | VIL    |        | VIH    |        | VOL    | VOH       | IOL           | IOH           | IOSL                 | IOSH                 | IIL <sup>2</sup>           | IIH <sup>3</sup>           |

Notes:

1. The minimum drive strength for any LVC MOS 3.3 V software configuration when run in wide range is  $\pm 100 \mu\text{A}$ . Drive strengths displayed in software are supported for normal range only. For a detailed I/V curve, refer to the IBIS models.
2. IIL is the input leakage current per I/O pin over recommended operation conditions where  $-0.3 \text{ V} < V_{\text{IN}} < V_{\text{IL}}$ .
3. IIH is the input leakage current per I/O pin over recommended operating conditions  $V_{\text{IH}} < V_{\text{IN}} < V_{\text{CCI}}$ . Input current is larger when operating outside recommended ranges
4. Currents are measured at 100°C junction temperature and maximum voltage.
5. Currents are measured at 85°C junction temperature.
6. Software default selection highlighted in gray.

**Table 2-104 • 1.8 V LVC MOS High Slew – Applies to 1.5 V DC Core Voltage****Commercial-Case Conditions:  $T_J = 70^\circ\text{C}$ , Worst-Case VCC = 1.425 V, Worst-Case VCCI = 1.7 V****Applicable to Standard Banks**

Notes:

1. IIL is the input leakage current per I/O pin over recommended operation conditions where  $-0.3\text{ V} < V_{IN} < V_{IL}$ .
2. IIH is the input leakage current per I/O pin over recommended operating conditions  $V_{IH} < V_{IN} < V_{CCI}$ . Input current is larger when operating outside recommended ranges
3. Currents are measured at 100°C junction temperature and maximum voltage.
4. Currents are measured at 85°C junction temperature.
5. Software default selection highlighted in gray.

**Figure 2-10 • AC Loading**

**Table 2-114 • AC Waveforms, Measuring Points, and Capacitive Loads**

| Input Low (V) | Input High (V) | Measuring Point* (V) | C <sub>LOAD</sub> (pF) |
|---------------|----------------|----------------------|------------------------|
| 0             | 1.5            | 0.75                 | 5                      |

Note: \*Measuring point = Vtrip. See Table 2-29 on page 2-28 for a complete table of trip points.

**Table 2-179 • AGL600 Global Resource****Commercial-Case Conditions:  $T_J = 70^\circ\text{C}$ ,  $V_{CC} = 1.425\text{ V}$** 

| Parameter     | Description                               | Std.              |                   | Units |
|---------------|-------------------------------------------|-------------------|-------------------|-------|
|               |                                           | Min. <sup>1</sup> | Max. <sup>2</sup> |       |
| $t_{RCKL}$    | Input Low Delay for Global Clock          | 1.48              | 1.82              | ns    |
| $t_{RCKH}$    | Input High Delay for Global Clock         | 1.52              | 1.94              | ns    |
| $t_{RCKMPWH}$ | Minimum Pulse Width High for Global Clock | 1.18              |                   | ns    |
| $t_{RCKMPWL}$ | Minimum Pulse Width Low for Global Clock  | 1.15              |                   | ns    |
| $t_{RCKSW}$   | Maximum Skew for Global Clock             |                   | 0.42              | ns    |

**Notes:**

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
3. For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.

**Table 2-180 • AGL1000 Global Resource****Commercial-Case Conditions:  $T_J = 70^\circ\text{C}$ ,  $V_{CC} = 1.425\text{ V}$** 

| Parameter     | Description                               | Std.              |                   | Units |
|---------------|-------------------------------------------|-------------------|-------------------|-------|
|               |                                           | Min. <sup>1</sup> | Max. <sup>2</sup> |       |
| $t_{RCKL}$    | Input Low Delay for Global Clock          | 1.55              | 1.89              | ns    |
| $t_{RCKH}$    | Input High Delay for Global Clock         | 1.60              | 2.02              | ns    |
| $t_{RCKMPWH}$ | Minimum Pulse Width High for Global Clock | 1.18              |                   | ns    |
| $t_{RCKMPWL}$ | Minimum Pulse Width Low for Global Clock  | 1.15              |                   | ns    |
| $t_{RCKSW}$   | Maximum Skew for Global Clock             |                   | 0.42              | ns    |

**Notes:**

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
3. For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.

Note: Peak-to-peak jitter measurements are defined by  $T_{\text{peak-to-peak}} = T_{\text{period\_max}} - T_{\text{period\_min}}$ .

**Figure 2-30 • Peak-to-Peak Jitter Definition**

Figure 2-34 • RAM Write, Output Retained. Applicable to Both RAM4K9 and RAM512x18.

Figure 2-35 • RAM Write, Output as Write Data (WMODE = 1). Applicable to RAM4K9 only.

## JTAG 1532 Characteristics

JTAG timing delays do not include JTAG I/Os. To obtain complete JTAG timing, add I/O buffer delays to the corresponding standard selected; refer to the I/O timing characteristics in the "User I/O Characteristics" section on page 2-20 for more details.

### Timing Characteristics

**Table 2-199 • JTAG 1532**

Commercial-Case Conditions:  $T_J = 70^\circ\text{C}$ , Worst-Case  $V_{CC} = 1.425\text{ V}$

| $t_{\text{RSTB2Q}}$  | Reset to Q (data out)       | 30.00 | ns    |
| $F_{\text{TCKMAX}}$  | TCK Maximum Frequency       | 9.00  | MHz   |
| $t_{\text{TRSTREM}}$ | ResetB Removal Time         | 1.18  | ns    |
| $t_{\text{TRSTREC}}$ | ResetB Recovery Time        | 0.00  | ns    |
| $t_{\text{TRSTMPW}}$ | ResetB Minimum Pulse        | TBD   | ns    |

Note: For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.

**VJTAG****JTAG Supply Voltage**

Low power flash devices have a separate bank for the dedicated JTAG pins. The JTAG pins can be run at any voltage from 1.5 V to 3.3 V (nominal). Isolating the JTAG power supply in a separate I/O bank gives greater flexibility in supply selection and simplifies power supply and PCB design. If the JTAG interface is neither used nor planned for use, the VJTAG pin together with the TRST pin could be tied to GND. It should be noted that VCC is required to be powered for JTAG operation; VJTAG alone is insufficient. If a device is in a JTAG chain of interconnected boards, the board containing the device can be powered down, provided both VJTAG and VCC to the part remain powered; otherwise, JTAG signals will not be able to transition the device, even in bypass mode.

Microsemi recommends that VPUMP and VJTAG power supplies be kept separate with independent filtering capacitors rather than supplying them from a common rail.

**VPUMP****Programming Supply Voltage**

IGLOO devices support single-voltage ISP of the configuration flash and FlashROM. For programming, VPUMP should be 3.3 V nominal. During normal device operation, VPUMP can be left floating or can be tied (pulled up) to any voltage between 0 V and the VPUMP maximum. Programming power supply voltage (VPUMP) range is listed in the datasheet.

When the VPUMP pin is tied to ground, it will shut off the charge pump circuitry, resulting in no sources of oscillation from the charge pump circuitry.

For proper programming, 0.01  $\mu$ F and 0.33  $\mu$ F capacitors (both rated at 16 V) are to be connected in parallel across VPUMP and GND, and positioned as close to the FPGA pins as possible.

Microsemi recommends that VPUMP and VJTAG power supplies be kept separate with independent filtering capacitors rather than supplying them from a common rail.

## User Pins

**I/O****User Input/Output**

The I/O pin functions as an input, output, tristate, or bidirectional buffer. Input and output signal levels are compatible with the I/O standard selected.

During programming, I/Os become tristated and weakly pulled up to VCCI. With VCCI, VMV, and VCC supplies continuously powered up, when the device transitions from programming to operating mode, the I/Os are instantly configured to the desired user configuration.

Unused I/Os are configured as follows:

- Output buffer is disabled (with tristate value of high impedance)
- Input buffer is disabled (with tristate value of high impedance)
- Weak pull-up is programmed

**GL****Globals**

GL I/Os have access to certain clock conditioning circuitry (and the PLL) and/or have direct access to the global network (spines). Additionally, the global I/Os can be used as regular I/Os, since they have identical capabilities. Unused GL pins are configured as inputs with pull-up resistors.

See more detailed descriptions of global I/O connectivity in the "Clock Conditioning Circuits in Low Power Flash Devices and Mixed Signal FPGAs" chapter of the *IGLOO FPGA Fabric User Guide*. All inputs labeled GC/GF are direct inputs into the quadrant clocks. For example, if GAA0 is used for an input, GAA1 and GAA2 are no longer available for input to the quadrant globals. All inputs labeled GC/GF are direct inputs into the chip-level globals, and the rest are connected to the quadrant globals. The inputs to the global network are multiplexed, and only one input can be used as a global input.

Refer to the "I/O Structures in IGLOO and ProASIC3 Devices" chapter of the *IGLOO FPGA Fabric User Guide* for an explanation of the naming of global pins.

**FF****Flash\*Freeze Mode Activation Pin**

Flash\*Freeze mode is available on IGLOO devices. The FF pin is a dedicated input pin used to enter and exit Flash\*Freeze mode. The FF pin is active low, has the same characteristics as a single-ended I/O, and must meet the maximum rise and fall times. When Flash\*Freeze mode is not used in the design, the FF pin is available as a regular I/O.

When Flash\*Freeze mode is used, the FF pin must not be left floating to avoid accidentally entering Flash\*Freeze mode. While in Flash\*Freeze mode, the Flash\*Freeze pin should be constantly asserted.
