
Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	3072
Total RAM Bits	36864
Number of I/O	133
Number of Gates	125000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	196-TFBGA, CSBGA
Supplier Device Package	196-CSP (8x8)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/agl125v5-cs196

IGLOO Device Family Overview

IGLOO DC and Switching Characteristics

Pin Descriptions

Package Pin Assignments

Datasheet Information

Table 2-3 • **Flash Programming Limits – Retention, Storage, and Operating Temperature**[1]

Product Grade	**Programming Cycles**	**Program Retention (biased/unbiased)**	**Maximum Storage Temperature T_{STG} (°C)** [2]	**Maximum Operating Junction Temperature T_J (°C)** [2]
Commercial	500	20 years	110	100
Industrial	500	20 years	110	100

Notes:

1. *This is a stress rating only; functional operation at any condition other than those indicated is not implied.*
2. *These limits apply for program/data retention only. Refer to Table 2-1 on page 2-1 and Table 2-2 on page 2-2 for device operating conditions and absolute limits.*

Table 2-4 • **Overshoot and Undershoot Limits** [1]

VCCI	**Average VCCI–GND Overshoot or Undershoot Duration as a Percentage of Clock Cycle**[2]	**Maximum Overshoot/ Undershoot**[2]
2.7 V or less	10%	1.4 V
	5%	1.49 V
3 V	10%	1.1 V
	5%	1.19 V
3.3 V	10%	0.79 V
	5%	0.88 V
3.6 V	10%	0.45 V
	5%	0.54 V

Notes:

1. *Based on reliability requirements at junction temperature at 85°C.*
2. *The duration is allowed at one out of six clock cycles. If the overshoot/undershoot occurs at one out of two cycles, the maximum overshoot/undershoot has to be reduced by 0.15 V.*
3. *This table does not provide PCI overshoot/undershoot limits.*

I/O Power-Up and Supply Voltage Thresholds for Power-On Reset (Commercial and Industrial)

Sophisticated power-up management circuitry is designed into every IGLOO device. These circuits ensure easy transition from the powered-off state to the powered-up state of the device. The many different supplies can power up in any sequence with minimized current spikes or surges. In addition, the I/O will be in a known state through the power-up sequence. The basic principle is shown in Figure 2-1 on page 2-4 and Figure 2-2 on page 2-5.

There are five regions to consider during power-up.

IGLOO I/Os are activated only if ALL of the following three conditions are met:

1. VCC and VCCI are above the minimum specified trip points (Figure 2-1 on page 2-4 and Figure 2-2 on page 2-5).
2. VCCI > VCC – 0.75 V (typical)
3. Chip is in the operating mode.

VCCI **Trip Point:**
Ramping up (V5 devices): 0.6 V < trip_point_up < 1.2 V
Ramping down (V5 Devices): 0.5 V < trip_point_down < 1.1 V
Ramping up (V2 devices): 0.75 V < trip_point_up < 1.05 V
Ramping down (V2 devices): 0.65 V < trip_point_down < 0.95 V

VCC **Trip Point:**
Ramping up (V5 devices): 0.6 V < trip_point_up < 1.1 V
Ramping down (V5 devices): 0.5 V < trip_point_down < 1.0 V

Ramping up (V2 devices): 0.65 V < trip_point_up < 1.05 V
Ramping down (V2 devices): 0.55 V < trip_point_down < 0.95 V

VCC and VCCI ramp-up trip points are about 100 mV higher than ramp-down trip points. This specifically built-in hysteresis prevents undesirable power-up oscillations and current surges. Note the following:

- During programming, I/Os become tristated and weakly pulled up to VCCI.
- JTAG supply, PLL power supplies, and charge pump VPUMP supply have no influence on I/O behavior.

PLL Behavior at Brownout Condition

Microsemi recommends using monotonic power supplies or voltage regulators to ensure proper power-up behavior. Power ramp-up should be monotonic at least until VCC and VCCPLX exceed brownout activation levels (see Figure 2-1 and Figure 2-2 on page 2-5 for more details).

When PLL power supply voltage and/or VCC levels drop below the VCC brownout levels (0.75 V ± 0.25 V for V5 devices, and 0.75 V ± 0.2 V for V2 devices), the PLL output lock signal goes low and/or the output clock is lost. Refer to the Brownout Voltage section in the "Power-Up/-Down Behavior of Low Power Flash Devices" chapter of the *ProASIC®3* and *ProASIC3E* FPGA fabric user guides for information on clock and lock recovery.

Internal Power-Up Activation Sequence

1. Core
2. Input buffers
3. Output buffers, after 200 ns delay from input buffer activation

To make sure the transition from input buffers to output buffers is clean, ensure that there is no path longer than 100 ns from input buffer to output buffer in your design.

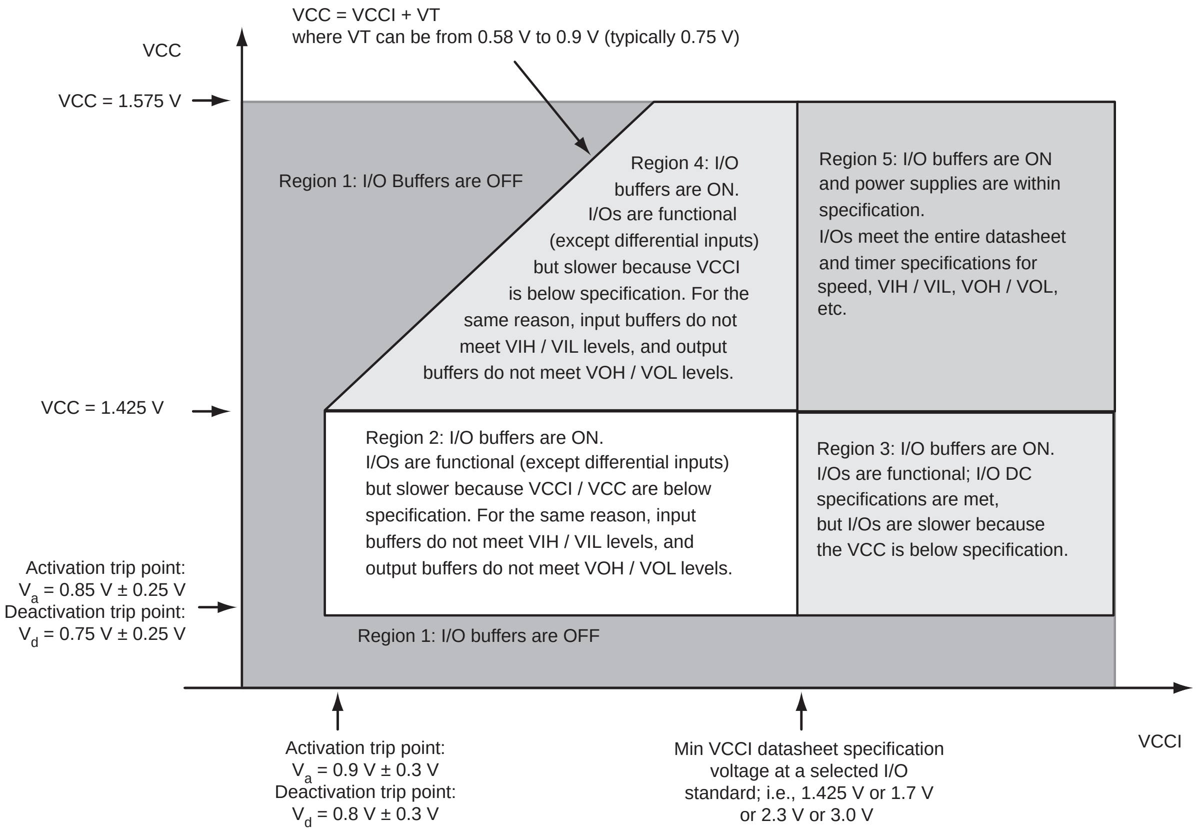

Figure 2-1 • **V5 Devices – I/O State as a Function of VCCI and VCC Voltage Levels**

Package Thermal Characteristics

The device junction-to-case thermal resistivity is θ_{jc} and the junction-to-ambient air thermal resistivity is θ_{ja}. The thermal characteristics for θ_{ja} are shown for two air flow rates. The absolute maximum junction temperature is 100°C. EQ 2 shows a sample calculation of the absolute maximum power dissipation allowed for the AGL1000-FG484 package at commercial temperature and in still air.

$$\text{Maximum Power Allowed} = \frac{\text{Max. junction temp. } (^\circ\text{C}) - \text{Max. ambient temp. } (^\circ\text{C})}{\theta_{ja}(^\circ\text{C/W})} = \frac{100^\circ\text{C} - 70^\circ\text{C}}{23.3^\circ\text{C/W}} = 1.28\text{ W}$$

EQ 2

Table 2-5 • Package Thermal Resistivities

Package Type	Device	Pin Count	θ_{jc}	θ_{ja}			Unit
				Still Air	1 m/s	2.5 m/s

	AGL1000	484	8.0	23.3	19.0	16.7	C/W

Note: **Thermal resistances for other device-package combinations will be posted in a later revision.*

Disclaimer:

The simulation for determining the junction-to-air thermal resistance is based on JEDEC standards (JESD51) and assumptions made in building the model. Junction-to-case is based on SEMI G38-88. JESD51 is only used for comparing one package to another package, provided the two tests uses the same condition. They have little relevance in actual application and therefore should be used with a degree of caution.

**Table 2-40 • I/O Output Buffer Maximum Resistances[1]
Applicable to Standard I/O Banks**

Standard	Drive Strength	$R_{PULL\text{-}DOWN}$ (Ω)[2]	$R_{PULL\text{-}UP}$ (Ω)[3]
3.3 V LVTTL / 3.3 V LVCMOS	2 mA	100	300
	4 mA	100	300
	6 mA	50	150
	8 mA	50	150
3.3 V LVCMOS Wide Range	100 µA	Same as regular 3.3 V LVCMOS	Same as regular 3.3 V LVCMOS
2.5 V LVCMOS	2 mA	100	200
	4 mA	100	200
	6 mA	50	100
	8 mA	50	100
1.8 V LVCMOS	2 mA	200	225
	4 mA	100	112
1.5 V LVCMOS	2 mA	200	224
1.2 V LVCMOS	1 mA	158	164
1.2 V LVCMOS Wide Range[4]	100 µA	Same as regular 1.2 V LVCMOS	Same as regular 1.2 V LVCMOS

Notes:

1. *These maximum values are provided for informational reasons only. Minimum output buffer resistance values depend on VCCI, drive strength selection, temperature, and process. For board design considerations and detailed output buffer resistances, use the corresponding IBIS models located at http://www.microsemi.com/soc/download/ibis/default.aspx.*
2. $R_{(PULL\text{-}DOWN\text{-}MAX)} = (VOLspec) / I_{OLspec}$
3. $R_{(PULL\text{-}UP\text{-}MAX)} = (VCCImax – VOHspec) / I_{OHspec}$

**Table 2-41 • I/O Weak Pull-Up/Pull-Down Resistances
Minimum and Maximum Weak Pull-Up/Pull-Down Resistance Values**

VCCI	$R_{(WEAK\ PULL\text{-}UP)}$[1] ($\Omega$)		$R_{(WEAK\ PULL\text{-}DOWN)}$[2] ($\Omega$)	
	Min.	**Max.**	**Min.**	**Max.**

Notes:

1. $R_{(WEAK\ PULL\text{-}UP\text{-}MAX)} = (VCCImax – VOHspec) / I_{(WEAK\ PULL\text{-}UP\text{-}MIN)}$
2. $R_{(WEAK\ PULLDOWN\text{-}MAX)} = (VOLspec) / I_{(WEAK\ PULLDOWN\text{-}MIN)}$

Single-Ended I/O Characteristics

3.3 V LVTTL / 3.3 V LVCMOS

Low-Voltage Transistor–Transistor Logic (LVTTL) is a general-purpose standard (EIA/JESD) for 3.3 V applications. It uses an LVTTL input buffer and push-pull output buffer. Furthermore, all LVCMOS 3.3 V software macros comply with LVCMOS 3.3 V wide range as specified in the JESD8a specification.

Table 2-47 • **Minimum and Maximum DC Input and Output Levels Applicable to Advanced I/O Banks**

3.3 V LVTTL / 3.3 V LVCMOS	VIL		VIH		VOL	VOH	IOL	IOH	IOSL	IOSH	IIL[1]	IIH[2]
Drive Strength	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA	Max. mA[3]	Max. mA[3]	µA[4]	µA[4]
2 mA	–0.3	0.8	2	3.6	0.4	2.4	2	2	25	27	10	10
4 mA	–0.3	0.8	2	3.6	0.4	2.4	4	4	25	27	10	10
6 mA	–0.3	0.8	2	3.6	0.4	2.4	6	6	51	54	10	10

1. *For more information, refer to the application note* Simultaneous Read-Write Operations in Dual-Port SRAM for Flash-Based cSoCs and FPGAs*.*
2. *For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.*

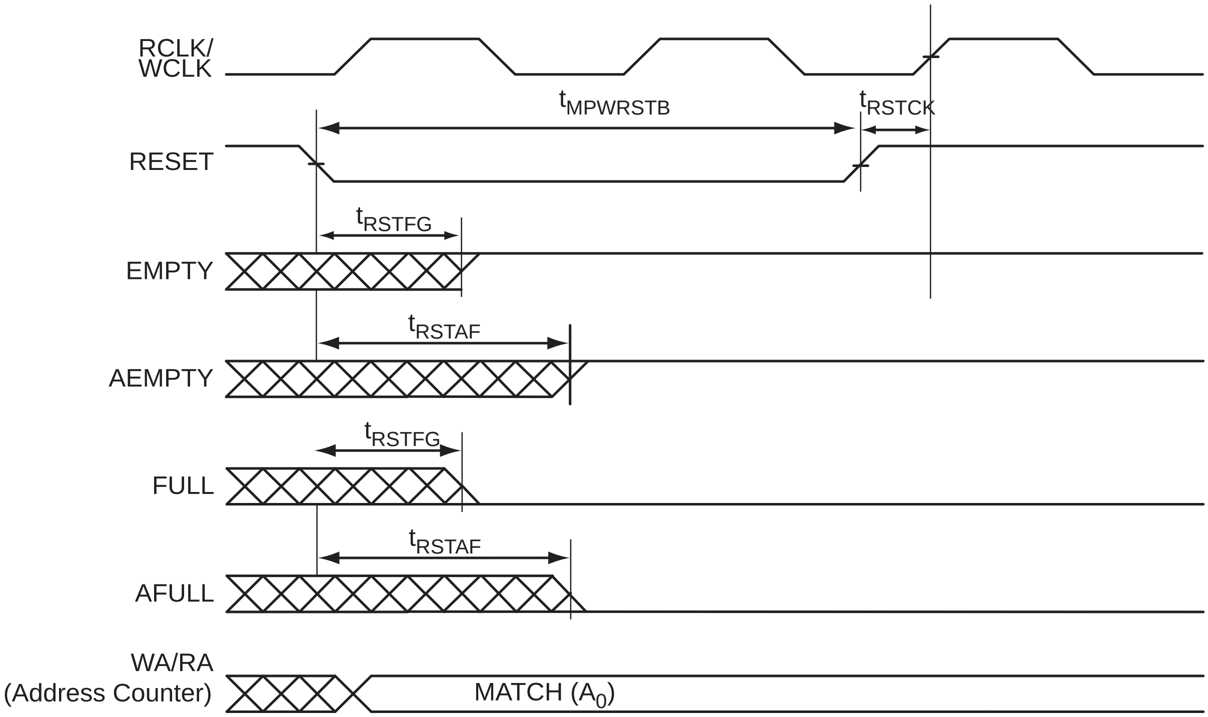

Figure 2-40 • FIFO Reset

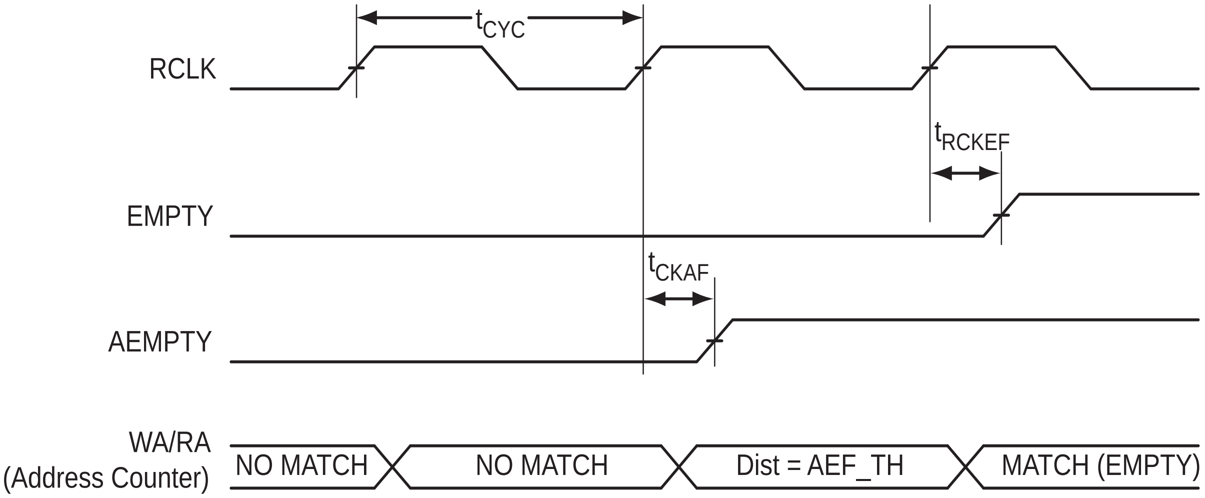

Figure 2-41 • FIFO EMPTY Flag and AEMPTY Flag Assertion

3 – Pin Descriptions

Supply Pins

GND **Ground**

Ground supply voltage to the core, I/O outputs, and I/O logic.

GNDQ **Ground (quiet)**

Quiet ground supply voltage to input buffers of I/O banks. Within the package, the GNDQ plane is decoupled from the simultaneous switching noise originated from the output buffer ground domain. This minimizes the noise transfer within the package and improves input signal integrity. GNDQ must always be connected to GND on the board.

VCC **Core Supply Voltage**

Supply voltage to the FPGA core, nominally 1.5 V for IGLOO V5 devices, and 1.2 V or 1.5 V for IGLOO V2 devices. VCC is required for powering the JTAG state machine in addition to VJTAG. Even when a device is in bypass mode in a JTAG chain of interconnected devices, both VCC and VJTAG must remain powered to allow JTAG signals to pass through the device.

For IGLOO V2 devices, VCC can be switched dynamically from 1.2 V to 1.5 V or vice versa. This allows in-system programming (ISP) when VCC is at 1.5 V and the benefit of low power operation when VCC is at 1.2 V.

VCCIBx **I/O Supply Voltage**

Supply voltage to the bank's I/O output buffers and I/O logic. Bx is the I/O bank number. There are up to eight I/O banks on IGLOO devices plus a dedicated VJTAG bank. Each bank can have a separate VCCI connection. All I/Os in a bank will run off the same VCCIBx supply. VCCI can be 1.2 V, 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VCCI pins tied to GND.

VMVx **I/O Supply Voltage (quiet)**

Quiet supply voltage to the input buffers of each I/O bank. *x* is the bank number. Within the package, the VMV plane biases the input stage of the I/Os in the I/O banks. This minimizes the noise transfer within the package and improves input signal integrity. Each bank must have at least one VMV connection, and no VMV should be left unconnected. All I/Os in a bank run off the same VMVx supply. VMV is used to provide a quiet supply voltage to the input buffers of each I/O bank. VMVx can be 1.2 V, 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VMV pins tied to GND. VMV and VCCI should be at the same voltage within a given I/O bank. Used VMV pins must be connected to the corresponding VCCI pins of the same bank (i.e., VMV0 to VCCIB0, VMV1 to VCCIB1, etc.).

VCCPLA/B/C/D/E/F **PLL Supply Voltage**

Supply voltage to analog PLL, nominally 1.5 V or 1.2 V.

- 1.5 V for IGLOO V5 devices
- 1.2 V or 1.5 V for IGLOO V2 devices

When the PLLs are not used, the Microsemi Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground. Microsemi recommends tying VCCPLx to VCC and using proper filtering circuits to decouple VCC noise from the PLLs. Refer to the PLL Power Supply Decoupling section of the "Clock Conditioning Circuits in Low Power Flash Devices and Mixed Signal FPGAs" chapter of the *IGLOO FPGA Fabric User Guide* for a complete board solution for the PLL analog power supply and ground.

- There is one VCCPLF pin on IGLOO devices.

VCOMPLA/B/C/D/E/F **PLL Ground**

Ground to analog PLL power supplies. When the PLLs are not used, the Microsemi Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground.

There is one VCOMPLF pin on IGLOO devices.
