

Welcome to [E-XFL.COM](#)

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	6144
Total RAM Bits	36864
Number of I/O	143
Number of Gates	250000
Voltage - Supply	1.14V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	196-TFBGA, CSBGA
Supplier Device Package	196-CSP (8x8)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/agl250v2-cs196

Ramping up (V2 devices): $0.65 \text{ V} < \text{trip_point_up} < 1.05 \text{ V}$

Ramping down (V2 devices): $0.55 \text{ V} < \text{trip_point_down} < 0.95 \text{ V}$

VCC and VCCI ramp-up trip points are about 100 mV higher than ramp-down trip points. This specifically built-in hysteresis prevents undesirable power-up oscillations and current surges. Note the following:

- During programming, I/Os become tristated and weakly pulled up to VCCI.
- JTAG supply, PLL power supplies, and charge pump VPUMP supply have no influence on I/O behavior.

PLL Behavior at Brownout Condition

Microsemi recommends using monotonic power supplies or voltage regulators to ensure proper power-up behavior. Power ramp-up should be monotonic at least until VCC and VCCPLX exceed brownout activation levels (see Figure 2-1 and Figure 2-2 on page 2-5 for more details).

When PLL power supply voltage and/or VCC levels drop below the VCC brownout levels ($0.75 \text{ V} \pm 0.25 \text{ V}$ for V5 devices, and $0.75 \text{ V} \pm 0.2 \text{ V}$ for V2 devices), the PLL output lock signal goes low and/or the output clock is lost. Refer to the Brownout Voltage section in the "Power-Up/-Down Behavior of Low Power Flash Devices" chapter of the ProASIC®3 and ProASIC3E FPGA fabric user guides for information on clock and lock recovery.

Internal Power-Up Activation Sequence

1. Core
2. Input buffers
3. Output buffers, after 200 ns delay from input buffer activation

To make sure the transition from input buffers to output buffers is clean, ensure that there is no path longer than 100 ns from input buffer to output buffer in your design.

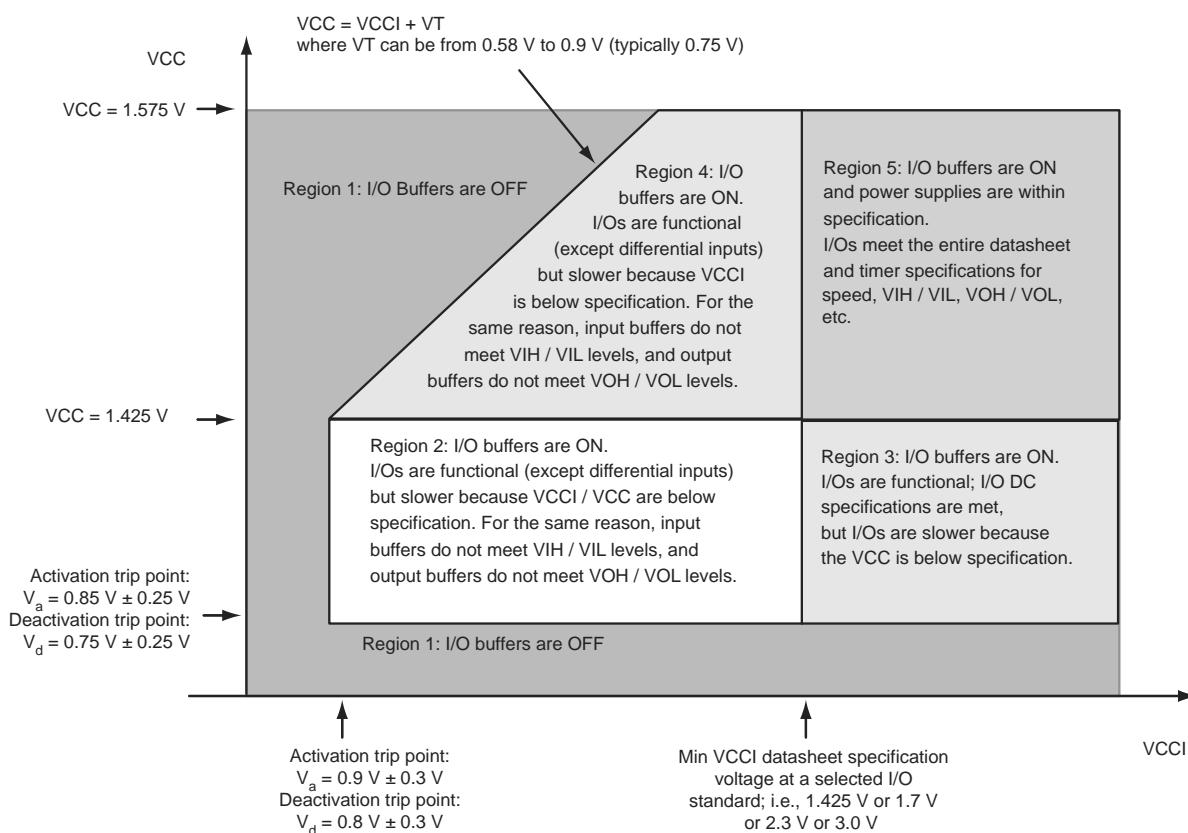

Figure 2-1 • V5 Devices – I/O State as a Function of VCCI and VCC Voltage Levels

Table 2-10 • Quiescent Supply Current (IDD) Characteristics, IGLOO Sleep Mode*

	Core Voltage	AGL015	AGL030	AGL060	AGL125	AGL250	AGL400	AGL600	AGL1000	Units

Notes:

1. $IDD = N_{BANKS} \times ICCI + ICCA$. JTAG counts as one bank when powered.
2. Includes VCC, VPUMP, and VCCPLL currents.
3. Values do not include I/O static contribution (PDC6 and PDC7).

Table 2-22 • Different Components Contributing to the Static Power Consumption in IGLOO Device For IGLOO V2 Devices, 1.2 V DC Core Supply Voltage

Parameter	Definition	Device Specific Static Power (mW)							
		AGL1000	AGL600	AGL400	AGL250	AGL125	AGL060	AGL030	AGL015
PDC1	Array static power in Active mode	See Table 2-12 on page 2-9.							
PDC2	Array static power in Static (Idle) mode	See Table 2-11 on page 2-8.							
PDC3	Array static power in Flash*Freeze mode	See Table 2-9 on page 2-7.							
PDC4	Static PLL contribution	0.90							
PDC5	Bank quiescent power (VCCI-Dependent)	See Table 2-12 on page 2-9.							
PDC6	I/O input pin static power (standard-dependent)	See Table 2-13 on page 2-10 through Table 2-15 on page 2-11.							
PDC7	I/O output pin static power (standard-dependent)	See Table 2-16 on page 2-11 through Table 2-18 on page 2-12.							

Note: For a different output load, drive strength, or slew rate, Microsemi recommends using the Microsemi power spreadsheet calculator or SmartPower tool in Libero SoC.

Table 2-34 • Summary of I/O Timing Characteristics Software Default Settings, Std. Speed Grade, Commercial-Case Conditions: $T_J = 70^\circ\text{C}$, Worst-Case VCC = 1.14 V, Worst-Case VCCI (per standard)

LVPECL	24 mA		High			1.55	2.24	0.26	1.38								ns

Notes:

1. The minimum drive strength for any LVC MOS 1.2 V or LVC MOS 3.3 V software configuration when run in wide range is -100 μ A. Drive strength displayed in the software is supported for normal range only. For a detailed I/V curve, refer to the IBIS models.
2. All LVC MOS 3.3 V software macros support LVC MOS 3.3 V wide range as specified in the JESD-8B specification.
3. All LVC MOS 1.2 V software macros support LVC MOS 1.2 V wide range as specified in the JESD8-12 specification
4. Resistance is used to measure I/O propagation delays as defined in PCI specification Figure 2-12 on page 2-7 for connectivity. This resistor is not required during normal operation.
5. For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.

Table 2-151 • Minimum and Maximum DC Input and Output Levels

DC Parameter	Description	Min.	Max.	Min.	Max.	Min.	Max.	Units

F_{MAX}	Maximum Frequency for FIFO	92	MHz

Note: For specific junction temperature and voltage supply levels, refer to Table 2-7 on page 2-7 for derating values.

3 – Pin Descriptions

Supply Pins

GND**Ground**

Ground supply voltage to the core, I/O outputs, and I/O logic.

GNDQ**Ground (quiet)**

Quiet ground supply voltage to input buffers of I/O banks. Within the package, the GNDQ plane is decoupled from the simultaneous switching noise originated from the output buffer ground domain. This minimizes the noise transfer within the package and improves input signal integrity. GNDQ must always be connected to GND on the board.

VCC**Core Supply Voltage**

Supply voltage to the FPGA core, nominally 1.5 V for IGLOO V5 devices, and 1.2 V or 1.5 V for IGLOO V2 devices. VCC is required for powering the JTAG state machine in addition to VJTAG. Even when a device is in bypass mode in a JTAG chain of interconnected devices, both VCC and VJTAG must remain powered to allow JTAG signals to pass through the device.

For IGLOO V2 devices, VCC can be switched dynamically from 1.2 V to 1.5 V or vice versa. This allows in-system programming (ISP) when VCC is at 1.5 V and the benefit of low power operation when VCC is at 1.2 V.

VCCI_{Bx}**I/O Supply Voltage**

Supply voltage to the bank's I/O output buffers and I/O logic. Bx is the I/O bank number. There are up to eight I/O banks on IGLOO devices plus a dedicated VJTAG bank. Each bank can have a separate VCCI connection. All I/Os in a bank will run off the same VCCI_{Bx} supply. VCCI can be 1.2 V, 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VCCI pins tied to GND.

VMV_x**I/O Supply Voltage (quiet)**

Quiet supply voltage to the input buffers of each I/O bank. x is the bank number. Within the package, the VMV plane biases the input stage of the I/Os in the I/O banks. This minimizes the noise transfer within the package and improves input signal integrity. Each bank must have at least one VMV connection, and no VMV should be left unconnected. All I/Os in a bank run off the same VMV_x supply. VMV is used to provide a quiet supply voltage to the input buffers of each I/O bank. VMV_x can be 1.2 V, 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VMV pins tied to GND. VMV and VCCI should be at the same voltage within a given I/O bank. Used VMV pins must be connected to the corresponding VCCI pins of the same bank (i.e., VMV0 to VCCI_{B0}, VMV1 to VCCI_{B1}, etc.).

VCCPLA/B/C/D/E/F**PLL Supply Voltage**

Supply voltage to analog PLL, nominally 1.5 V or 1.2 V.

- 1.5 V for IGLOO V5 devices
- 1.2 V or 1.5 V for IGLOO V2 devices

When the PLLs are not used, the Microsemi Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground. Microsemi recommends tying VCCPLx to VCC and using proper filtering circuits to decouple VCC noise from the PLLs. Refer to the PLL Power Supply Decoupling section of the "Clock Conditioning Circuits in Low Power Flash Devices and Mixed Signal FPGAs" chapter of the *IGLOO FPGA Fabric User Guide* for a complete board solution for the PLL analog power supply and ground.

- There is one VCCPLF pin on IGLOO devices.

VCOMPLA/B/C/D/E/F**PLL Ground**

Ground to analog PLL power supplies. When the PLLs are not used, the Microsemi Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground.

There is one VCOMPLF pin on IGLOO devices.
