Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	9216
Total RAM Bits	55296
Number of I/O	143
Number of Gates	400000
Voltage - Supply	1.14V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 85°C (TA)
Package / Case	196-TFBGA, CSBGA
Supplier Device Package	196-CSP (8x8)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/agl400v2-csg196i

1 – IGLOO Device Family Overview

General Description

The IGLOO family of flash FPGAs, based on a 130-nm flash process, offers the lowest power FPGA, a single-chip solution, small footprint packages, reprogrammability, and an abundance of advanced features.

The Flash*Freeze technology used in IGLOO devices enables entering and exiting an ultra-low power mode that consumes as little as 5 μ W while retaining SRAM and register data. Flash*Freeze technology simplifies power management through I/O and clock management with rapid recovery to operation mode.

The Low Power Active capability (static idle) allows for ultra-low power consumption (from 12 μ W) while the IGLOO device is completely functional in the system. This allows the IGLOO device to control system power management based on external inputs (e.g., scanning for keyboard stimulus) while consuming minimal power.

Nonvolatile flash technology gives IGLOO devices the advantage of being a secure, low power, single-chip solution that is Instant On. IGLOO is reprogrammable and offers time-to-market benefits at an ASIC-level unit cost.

These features enable designers to create high-density systems using existing ASIC or FPGA design flows and tools.

IGLOO devices offer 1 kbit of on-chip, reprogrammable, nonvolatile FlashROM storage as well as clock conditioning circuitry based on an integrated phase-locked loop (PLL). The AGL015 and AGL030 devices have no PLL or RAM support. IGLOO devices have up to 1 million system gates, supported with up to 144 kbits of true dual-port SRAM and up to 300 user I/Os.

M1 IGLOO devices support the high-performance, 32-bit Cortex-M1 processor developed by ARM for implementation in FPGAs. Cortex-M1 is a soft processor that is fully implemented in the FPGA fabric. It has a three-stage pipeline that offers a good balance between low power consumption and speed when implemented in an M1 IGLOO device. The processor runs the ARMv6-M instruction set, has a configurable nested interrupt controller, and can be implemented with or without the debug block. Cortex-M1 is available for free from Microsemi for use in M1 IGLOO FPGAs.

The ARM-enabled devices have ordering numbers that begin with M1AGL and do not support AES decryption.

Flash*Freeze Technology

The IGLOO device offers unique Flash*Freeze technology, allowing the device to enter and exit ultra-low power Flash*Freeze mode. IGLOO devices do not need additional components to turn off I/Os or clocks while retaining the design information, SRAM content, and registers. Flash*Freeze technology is combined with in-system programmability, which enables users to quickly and easily upgrade and update their designs in the final stages of manufacturing or in the field. The ability of IGLOO V2 devices to support a wide range of core voltage (1.2 V to 1.5 V) allows further reduction in power consumption, thus achieving the lowest total system power.

When the IGLOO device enters Flash*Freeze mode, the device automatically shuts off the clocks and inputs to the FPGA core; when the device exits Flash*Freeze mode, all activity resumes and data is retained.

The availability of low power modes, combined with reprogrammability, a single-chip and single-voltage solution, and availability of small-footprint, high pin-count packages, make IGLOO devices the best fit for portable electronics.

Thermal Characteristics

Introduction

The temperature variable in the Designer software refers to the junction temperature, not the ambient temperature. This is an important distinction because dynamic and static power consumption cause the chip junction to be higher than the ambient temperature.

EQ 1 can be used to calculate junction temperature.

$$T_J = \text{Junction Temperature} = \Delta T + T_A$$

EQ 1

where:

T_A = Ambient Temperature

ΔT = Temperature gradient between junction (silicon) and ambient $\Delta T = \theta_{ja} * P$

θ_{ja} = Junction-to-ambient of the package. θ_{ja} numbers are located in Table 2-5 on page 2-6.

P = Power dissipation

1.2 V DC Core Voltage

Table 2-193 • RAM4K9

Commercial-Case Conditions: $T_J = 70^\circ\text{C}$, Worst-Case $V_{CC} = 1.14\text{ V}$

Parameter	Description	Std.	Units
t_{AS}	Address setup time	1.53	ns
t_{AH}	Address hold time	0.29	ns
t_{ENS}	REN WEN setup time	1.50	ns
t_{ENH}	REN, WEN hold time	0.29	ns
t_{BKS}	BLK setup time	3.05	ns
t_{BKH}	BLK hold time	0.29	ns
t_{DS}	Input data (DIN) setup time	1.33	ns
t_{DH}	Input data (DIN) hold time	0.66	ns
t_{CKQ1}	Clock High to new data valid on DOUT (output retained, WMODE = 0)	6.61	ns
	Clock High to new data valid on DOUT (flow-through, WMODE = 1)	5.72	ns
t_{CKQ2}	Clock High to new data valid on DOUT (pipelined)	3.38	ns
t_{C2CWWL}^1	Address collision clk-to-clk delay for reliable write after write on same address – Applicable to Closing Edge	0.30	ns
t_{C2CRWH}^1	Address collision clk-to-clk delay for reliable read access after write on same address – Applicable to Opening Edge	0.89	ns
t_{C2CWRH}^1	Address collision clk-to-clk delay for reliable write access after read on same address – Applicable to Opening Edge	1.01	ns
t_{RSTBQ}	RESET Low to data out Low on DOUT (flow-through)	3.86	ns
	RESET Low to data out Low on DOUT (pipelined)	3.86	ns
$t_{REMRSTB}$	RESET removal	1.12	ns
$t_{RECRSTB}$	RESET recovery	5.93	ns
$t_{MPWRSTB}$	RESET minimum pulse width	1.18	ns
t_{CYC}	Clock cycle time	10.90	ns
F_{MAX}	Maximum frequency	92	MHz

Notes:

1. For more information, refer to the application note Simultaneous Read-Write Operations in Dual-Port SRAM for Flash-Based cSoCs and FPGAs.
2. For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.

Table 2-194 • RAM512X18**Commercial-Case Conditions: $T_J = 70^\circ\text{C}$, Worst-Case $V_{CC} = 1.14\text{ V}$**

Parameter	Description	Std.	Units
t_{AS}	Address setup time	1.53	ns
t_{AH}	Address hold time	0.29	ns
t_{ENS}	REN, WEN setup time	1.36	ns
t_{ENH}	REN, WEN hold time	0.15	ns
t_{DS}	Input data (WD) setup time	1.33	ns
t_{DH}	Input data (WD) hold time	0.66	ns
t_{CKQ1}	Clock High to new data valid on RD (output retained)	7.88	ns
t_{CKQ2}	Clock High to new data valid on RD (pipelined)	3.20	ns
t_{C2CRWH}^1	Address collision clk-to-clk delay for reliable read access after write on same address – Applicable to Opening Edge	0.87	ns
t_{C2CWRH}^1	Address collision clk-to-clk delay for reliable write access after read on same address – Applicable to Opening Edge	1.04	ns
t_{RSTBQ}	RESET Low to data out Low on RD (flow through)	3.86	ns
	RESET Low to data out Low on RD (pipelined)	3.86	ns
$t_{REMRSTB}$	RESET removal	1.12	ns
$t_{RECRSTB}$	RESET recovery	5.93	ns
$t_{MPWRSTB}$	RESET minimum pulse width	1.18	ns
t_{CYC}	Clock cycle time	10.90	ns
F_{MAX}	Maximum frequency	92	MHz

Notes:

1. For more information, refer to the application note Simultaneous Read-Write Operations in Dual-Port SRAM for Flash-Based cSoCs and FPGAs.
2. For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.

Timing Characteristics

1.5 V DC Core Voltage

Table 2-195 • FIFO

Worst Commercial-Case Conditions: $T_J = 70^\circ\text{C}$, $V_{CC} = 1.425\text{ V}$

Parameter	Description	Std.	Units
t_{ENS}	REN, WEN Setup Time	1.99	ns
t_{ENH}	REN, WEN Hold Time	0.16	ns
t_{BKS}	BLK Setup Time	0.30	ns
t_{BKH}	BLK Hold Time	0.00	ns
t_{DS}	Input Data (WD) Setup Time	0.76	ns
t_{DH}	Input Data (WD) Hold Time	0.25	ns
t_{CKQ1}	Clock High to New Data Valid on RD (flow-through)	3.33	ns
t_{CKQ2}	Clock High to New Data Valid on RD (pipelined)	1.80	ns
t_{RCKEF}	RCLK High to Empty Flag Valid	3.53	ns
t_{WCKFF}	WCLK High to Full Flag Valid	3.35	ns
t_{CKAF}	Clock High to Almost Empty/Full Flag Valid	12.85	ns
t_{RSTFG}	RESET Low to Empty/Full Flag Valid	3.48	ns
t_{RSTAF}	RESET Low to Almost Empty/Full Flag Valid	12.72	ns
t_{RSTBQ}	RESET Low to Data Out Low on RD (flow-through)	2.02	ns
	RESET Low to Data Out Low on RD (pipelined)	2.02	ns
t_{REMRSTB}	RESET Removal	0.61	ns
t_{RECRSTB}	RESET Recovery	3.21	ns
t_{MPWRSTB}	RESET Minimum Pulse Width	0.68	ns
t_{CYC}	Clock Cycle Time	6.24	ns
F_{MAX}	Maximum Frequency for FIFO	160	MHz

Note: For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.

The Flash*Freeze pin can be used with any single-ended I/O standard supported by the I/O bank in which the pin is located, and input signal levels compatible with the I/O standard selected. The FF pin should be treated as a sensitive asynchronous signal. When defining pin placement and board layout, simultaneously switching outputs (SSOs) and their effects on sensitive asynchronous pins must be considered.

Unused FF or I/O pins are tristated with weak pull-up. This default configuration applies to both Flash*Freeze mode and normal operation mode. No user intervention is required.

Table 3-1 shows the Flash*Freeze pin location on the available packages for IGLOO a devices. The Flash*Freeze pin location is independent of device, allowing migration to larger or smaller IGLOO devices while maintaining the same pin location on the board. Refer to the "Flash*Freeze Technology and Low Power Modes" chapter of the *IGLOO FPGA Fabric User Guide* for more information on I/O states during Flash*Freeze mode.

Table 3-1 • Flash*Freeze Pin Location in IGLOO Family Packages (device-independent)
