
Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	13824
Total RAM Bits	110592
Number of I/O	215
Number of Gates	600000
Voltage - Supply	1.14V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	281-TFBGA, CSBGA
Supplier Device Package	281-CSP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/agl600v2-csg281

Notes:

1. *When considering migrating your design to a lower- or higher-density device, refer to the* IGLOO FPGA Fabric User Guide *to ensure compliance with design and board migration requirements.*
2. *AGL015 is not recommended for new designs.*
3. *When the Flash*Freeze pin is used to directly enable Flash*Freeze mode and not used as a regular I/O, the number of single-ended user I/Os available is reduced by one.*
4. *Each used differential I/O pair reduces the number of single-ended I/Os available by two.*
5. *The M1AGL250 device does not support QN132 or CS196 packages.*
6. *Package not available.*
7. *FG256 and FG484 are footprint-compatible packages.*

Calculating Power Dissipation

Quiescent Supply Current

Quiescent supply current (IDD) calculation depends on multiple factors, including operating voltages (VCC, VCCI, and VJTAG), operating temperature, system clock frequency, and power modes usage. Microsemi recommends using the PowerCalculator and SmartPower software estimation tools to evaluate the projected static and active power based on the user design, power mode usage, operating voltage, and temperature.

Table 2-8 • **Power Supply State per Mode**

	Power Supply Configurations				
Modes/power supplies	**VCC**	**VCCPLL**	**VCCI**	**VJTAG**	**VPUMP**
Flash*Freeze	On	On	On	On	On/off/floating
Sleep	Off	Off	On	Off	Off
Shutdown	Off	Off	Off	Off	Off
No Flash*Freeze	On	On	On	On	On/off/floating

Note: Off: Power supply level = 0 V

Table 2-9 • **Quiescent Supply Current (IDD) Characteristics, IGLOO Flash*Freeze Mode***

$t_{DDRICKMPWL}$	Clock Minimum Pulse Width Low for Input DDR	0.28	ns
$F_{DDRIMAX}$	Maximum Frequency for Input DDR	250.00	MHz

Note: For specific junction temperature and voltage supply levels, refer to Table 2-7 on page 2-7 for derating values.

Global Tree Timing Characteristics

Global clock delays include the central rib delay, the spine delay, and the row delay. Delays do not include I/O input buffer clock delays, as these are I/O standard–dependent, and the clock may be driven and conditioned internally by the CCC module. For more details on clock conditioning capabilities, refer to the "Clock Conditioning Circuits" section on page 2-115. Table 2-173 to Table 2-188 on page 2-114 present minimum and maximum global clock delays within each device. Minimum and maximum delays are measured with minimum and maximum loading.

Timing Characteristics

1.5 V DC Core Voltage

Table 2-173 • **AGL015 Global Resource**
Commercial-Case Conditions: T_J = 70°C, VCC = 1.425 V

Parameter	Description	Std.		Units
		Min.[1]	Max.[2]	
t_{RCKL}	Input Low Delay for Global Clock	1.21	1.42	ns
t_{RCKH}	Input High Delay for Global Clock	1.23	1.49	ns
$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock	1.18		ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock	1.15		ns
t_{RCKSW}	Maximum Skew for Global Clock		0.27	ns

Notes:

1. *Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).*
2. *Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).*
3. *For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.*

Table 2-174 • **AGL030 Global Resource**
Commercial-Case Conditions: T_J = 70°C, VCC = 1.425 V

Parameter	Description	Std.		Units
		Min.[1]	Max.[2]	
t_{RCKL}	Input Low Delay for Global Clock	1.21	1.42	ns

F_{MAX}	Maximum frequency	160	MHz

Notes:

1. *For more information, refer to the application note* Simultaneous Read-Write Operations in Dual-Port SRAM for Flash-Based cSoCs and FPGAs*.*
2. *For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.*

VJTAG JTAG Supply Voltage

Low power flash devices have a separate bank for the dedicated JTAG pins. The JTAG pins can be run at any voltage from 1.5 V to 3.3 V (nominal). Isolating the JTAG power supply in a separate I/O bank gives greater flexibility in supply selection and simplifies power supply and PCB design. If the JTAG interface is neither used nor planned for use, the VJTAG pin together with the TRST pin could be tied to GND. It should be noted that VCC is required to be powered for JTAG operation; VJTAG alone is insufficient. If a device is in a JTAG chain of interconnected boards, the board containing the device can be powered down, provided both VJTAG and VCC to the part remain powered; otherwise, JTAG signals will not be able to transition the device, even in bypass mode.

Microsemi recommends that VPUMP and VJTAG power supplies be kept separate with independent filtering capacitors rather than supplying them from a common rail.

VPUMP Programming Supply Voltage

IGLOO devices support single-voltage ISP of the configuration flash and FlashROM. For programming, VPUMP should be 3.3 V nominal. During normal device operation, VPUMP can be left floating or can be tied (pulled up) to any voltage between 0 V and the VPUMP maximum. Programming power supply voltage (VPUMP) range is listed in the datasheet.

When the VPUMP pin is tied to ground, it will shut off the charge pump circuitry, resulting in no sources of oscillation from the charge pump circuitry.

For proper programming, 0.01 µF and 0.33 µF capacitors (both rated at 16 V) are to be connected in parallel across VPUMP and GND, and positioned as close to the FPGA pins as possible.

Microsemi recommends that VPUMP and VJTAG power supplies be kept separate with independent filtering capacitors rather than supplying them from a common rail.

User Pins

I/O User Input/Output

The I/O pin functions as an input, output, tristate, or bidirectional buffer. Input and output signal levels are compatible with the I/O standard selected.

During programming, I/Os become tristated and weakly pulled up to VCCI. With VCCI, VMV, and VCC supplies continuously powered up, when the device transitions from programming to operating mode, the I/Os are instantly configured to the desired user configuration.

Unused I/Os are configured as follows:

- Output buffer is disabled (with tristate value of high impedance)
- Input buffer is disabled (with tristate value of high impedance)
- Weak pull-up is programmed

GL Globals

GL I/Os have access to certain clock conditioning circuitry (and the PLL) and/or have direct access to the global network (spines). Additionally, the global I/Os can be used as regular I/Os, since they have identical capabilities. Unused GL pins are configured as inputs with pull-up resistors.

See more detailed descriptions of global I/O connectivity in the "Clock Conditioning Circuits in Low Power Flash Devices and Mixed Signal FPGAs" chapter of the *IGLOO FPGA Fabric User Guide*. All inputs labeled GC/GF are direct inputs into the quadrant clocks. For example, if GAA0 is used for an input, GAA1 and GAA2 are no longer available for input to the quadrant globals. All inputs labeled GC/GF are direct inputs into the chip-level globals, and the rest are connected to the quadrant globals. The inputs to the global network are multiplexed, and only one input can be used as a global input.

Refer to the "I/O Structures in IGLOO and ProASIC3 Devices" chapter of the *IGLOO FPGA Fabric User Guide* for an explanation of the naming of global pins.

FF Flash*Freeze Mode Activation Pin

Flash*Freeze mode is available on IGLOO devices. The FF pin is a dedicated input pin used to enter and exit Flash*Freeze mode. The FF pin is active low, has the same characteristics as a single-ended I/O, and must meet the maximum rise and fall times. When Flash*Freeze mode is not used in the design, the FF pin is available as a regular I/O.

When Flash*Freeze mode is used, the FF pin must not be left floating to avoid accidentally entering Flash*Freeze mode. While in Flash*Freeze mode, the Flash*Freeze pin should be constantly asserted.
